AFRICA 2.0

Prioritizing investments in children to reap the demographic dividend

GENERATION 2030

AFRICA 2.0

Prioritizing investments in children to reap the demographic dividend
This report follows up the first Generation 2030 Africa report, published in August 2014, which outlined pivotal changes in Africa's child demographics. The report presents modelling indicating that if African nations invest in their growing population of children and young people, in particular in their education, and adopt economic policies that foster new jobs, the continent as a whole could see per capita incomes increase up to four-fold. The first, crucial step to achieving this demographic dividend will be to close the gaps that exist within Africa’s health and education systems.

Acknowledgements

This report has benefited from valuable inputs by many colleagues throughout UNICEF and beyond, including colleagues from UNICEF’s Regional Offices for Eastern and Southern Africa, West and Central Africa and the Middle East and Northern Africa, UNICEF Headquarters and UNICEF country offices in Africa. Particular thanks to Leila Pakkala, Regional Director, Eastern and Southern Africa, Marie-Pierre Poirot, Regional Director, West and Central Africa and Geert Cappalaeare, Regional Director, Middle East and Northern Africa for their support and guidance throughout the report’s production.

Sincere thanks also go to UNICEF colleagues who made a significant contribution to the report.

EXECUTIVE SUMMARY

Prioritizing investments in children to reap the demographic dividend

Key policy actions for Generation 2030 Africa

1. Essential Services
Scale up Africa’s essential services and strengthen health, social welfare and protection systems, bringing them up to international standards, or beyond for countries already close to meeting them.

2. Skills enhancement
Transform Africa’s educational, skills and vocational learning systems through systems-strengthening, curriculum reform and access to technology, to enhance learning outcomes and connectivity and to match the skills of Africa’s children and youth to current and future labour market needs.

3. Protection
Protect Africa’s children and women from violence, exploitation and abuse, especially child marriage and harmful practices; empower children and women to participate fully in community, workplace and political life; and enhance access to culturally sensitive reproductive health services.

4. Invest in children
Maximize the use of available resources (domestic and international) to increase investments in Africa’s children and youth, targeting the most effective programmes and population groups with the greatest need.
Across Africa countries are experiencing varying degrees of rapid population growth

THE DEMOGRAPHIC WINDOW OF OPPORTUNITY

The term ‘demographic dividend’ refers to the economic growth that can be achieved by having proportionally more working age people as a share of the population. It is driven by the demographic transition of a country’s population. As mortality and fertility decline, the population’s age structure changes. With fewer births each year, a country’s young, dependent population grows smaller in relation to the working age population. This is the period when the dividend can materialize: the increasing share of working age population compared to other age groups leaves each working age person with fewer dependents to support, and thus more disposable income that can spur greater consumption, production and investment and, in turn, accelerate growth.

The window of opportunity for a demographic dividend is closely linked with such demographic transitions. There are no distinct criteria that defines the beginning and end of the window, but it begins to open when the share of working age population is increasing and fertility reduction has progressed far enough to reduce the dependent child population. The window begins to close when the share of the working age population starts to shrink again due to continued low fertility and the increasing share of the elderly in the population.

This report uses a typology developed by the World Bank that classifies countries according to their potential for reaping a demographic dividend based on two demographic indicators: the share of the working age population and fertility levels.

Pre-dividend countries: Countries whose share of working age population will increase between 2015 and 2030 have an opportunity to reap a demographic dividend. Among them, those that had comparatively high total fertility (four or more births per woman) in 2015, are classified as ‘pre-dividend’ countries, since the window of the opportunity for accelerated economic growth has not yet opened due to ongoing rapid population growth, resulting in a high child dependency ratio. Two thirds of countries in Africa (36 countries) are in this phase.

Early-dividend countries: Countries showing a relative increase in the working age population and a total fertility of less than four births per woman in 2015 are further along the path toward reduced fertility and thus experiencing lower child dependency ratios and a higher proportion of working age population. These countries are classified as ‘early-dividend’ countries, one fourth (14) of African countries fall into this category.

Late-dividend countries: Countries with a declining share of working age population between 2015 and 2030 face a closing window for their first demographic dividend. Countries that in 1985 – roughly one generation ago – had a total fertility rate above replacement level are classified as ‘late-dividend’ countries. Most late-dividend countries have a large share of working age population and are in a position to continue ‘harvesting’ the benefits of the first demographic dividend, but will face fundamental changes in coming years. Only four African countries – Mauritius, Morocco, Seychelles and Tunisia – are at this stage.

Post-dividend countries: ‘Post-dividend’ countries have experienced below-replacement level fertility since 1985, and will face a rapidly increasing elderly population, further decreasing the already diminishing share of working age population. No African countries have such characteristics, yet. In Asia, five countries or territories have already reached this stage: the Chinese Special Administrative Regions of Hong Kong and Macau, Japan, the Republic of Korea and Singapore.

Criteria for classification of demographic dividend type

| Share working-age population is projected to INCREASE from 2015 to 2030. |
| Share working-age population is projected to DECREASE or stay unchanged 2015 to 2030. |
| Total fertility rate 2015 >= 4: pre-dividend |
| Total fertility rate 1985 > 2.1: late-dividend |
| Total fertility rate 2015 < 4: early-dividend |
| Total fertility rate 1985 <= 2.1: post-dividend |

Many children, few elderly
High fertility rates leading to high dependency ratios with many children per 100 working age adults.

Increasing share of workers
Increasing share of working age population leads to lower dependency ratio which opens up the window for a demographic dividend.

Decreasing share of workers
The share of the working age population is high though decreasing. Opportunity for a strong economic growth but the window of opportunity is closing.

Few children, many elderly
Countries with fertility rates often under replacement level. Share of working age population is shrinking further due to an increasing share of elderly.
Africa’s children stand at a pivotal moment in their continent’s demographic transition

Nowhere in the world are children more central to a continent’s future than in Africa, where they account for almost half (47 per cent) of all inhabitants. The expansion occurring in recent decades has been extraordinary. In 1950, Africa’s child population stood at 110 million and represented just above 10 per cent of the world’s child population. It has grown more than fivefold since, and currently stands at an estimated 580 million: four times larger than Europe’s child population, and accounting for about 25 per cent of the world’s children. Between 2016 and 2030, Africa’s child population is projected to expand by about 170 million, elevating the continent’s total to 750 million. And by 2056 Africa will be home to 1 billion children, almost 40 per cent of the global total. By the end of the century, it is projected that Africa will be home to nearly half of the world’s children.

The large increase in Africa’s child population mirrors the rise in the continent’s overall population, set to more than double between now and mid-century, adding a further 1.3 billion people and reaching 2.5 billion by 2050. These projections are based on median variants of fertility projected by the UN Population Division in its 2017 edition of *World Population Prospects*. They take into account the prospect of declining fertility rates in Africa in the coming years, as well as continuing fertility trends in other regions.³

These data projections have limitations, and actual demographic trends may differ from projections, due to policy interventions and others changes in economic, social, political, or environmental factors. For example, policies could alter fertility rates, mortality and migration patterns. Nevertheless, the key points highlighted in this report are considered to have implications for global, regional and national actions. The sheer number of Africa’s children and its growing share of the world’s child population means that dividends for the continent will be dividends for the world and for humanity, including the most disadvantaged and vulnerable.

Demographic transitions of this magnitude present both immense opportunities and immense challenges. The opportunity for Africa lies in the vast potential of its current and future generations of children and youth. Today, two thirds of African Union (AU) Member States are still in the pre-dividend phase of demographic transition, characterized by high fertility rates and high dependency ratios. It is imperative to recognize that today’s rapidly increasing child and youth populations will soon constitute Africa’s working age population. Investing in their health, protection and education holds the promise for reaping a demographic dividend in the 21st century that could lift hundreds of millions out of extreme poverty and contribute to enhanced prosperity, stability and peace on the continent.

However, failure to prioritize these investments will lead to a far bleaker scenario, because the opportunity to reap a demographic dividend is time-sensitive and influenced by policies. With more than half of African countries unlikely to reach their demographic window of opportunity – the period when a country’s population structure is the most favourable for accelerated economic growth – until 2030 or beyond, it becomes all the more urgent to adequately prepare so that when the window of opportunity opens, African nations can best harness and capitalize on the dividend.⁴

Numerous studies have shown the transformative power of investment in essential services for children and youth, their societies and economies.⁵ The modelling exercise of Africa’s demographic dividend potential presented in this report shows that the continent’s per capita income could quadruple by 2050 if such investments in human capital were complemented by policies that foster job creation, empower and protect women and girls, and expand access to culturally sensitive reproductive health education and services.

The challenge lies in making these investments. Closing the gaps that presently exist between minimum international standards and actual health care and education services is a critical first step toward building the human capital required
for a demographic dividend. This must become a key priority, especially for those countries in Central, Eastern and Western Africa where the gaps are widest. Africa as a whole faces the challenge of employing an additional 5.6 million frontline health professionals – three times current numbers – to meet the minimum threshold set by the World Health Organization (WHO) by 2030. More than 5.8 million additional teachers are required to attain a pupil-teacher ratio in every country equivalent to the best-performing country in each of Africa’s five sub-regions. Although Northern Africa and Southern Africa fare much better in this respect, they still face challenges that other African sub-regions also share: reaching international standards, enhancing the quality of health care and education and ensuring that education is relevant to the 21st century labour market.

If these key investments are not made now, the continent will not be able to reap the benefits of the demographic dividend. Poor health and insufficient education will prevent children from developing to their full potential, and will sustain high poverty rates, elevated unemployment and underemployment, leading to stagnant economic growth and resulting in a missed opportunity for the continent.

The years between now and 2030 are critical for building Africa’s human capital. Investing in youth, selected as the AU’s main focus in 2017, is imperative and needs to be complemented by an equally strong emphasis on investing in children to establish the strongest foundation for Africa’s future.

Policy actions for Generation 2030 Africa:

- **Scale-up Africa’s essential services and strengthen health, social welfare and protection systems** bringing them up to international standards, or beyond minimum standards for those countries already close to meeting them.

- **Transform Africa’s educational, skills and vocational learning systems through systems-strengthening, curriculum reform and access to technology**, to enhance learning outcomes and match the skills of Africa’s children and youth to current and future labour market needs.

- **Protect Africa’s children and women from violence, exploitation and abuse, especially child marriage and harmful practices, and empower women and girls** to participate fully in community, workplace and political life, as well as enhancing their access to culturally sensitive reproductive health services.

Undertaking these policy actions will require scaling up investments in children and youth:

- **Maximize the use of available resources (domestic and international) to increase investment in Africa’s children and youth**, targeting the most effective programmes and population groups with the greatest need.

As 2017 begins to wind down, African Union Member States and other stakeholders are faced with the challenge of stepping up investments in children and youth to ensure that African countries are well positioned to reap the benefits of a demographic dividend. Although this report focuses on government actions required to reap the demographic dividend, involvement by a wide range of stakeholders, including non-government organizations, religious groups, the private sector and children and youth themselves is also vital.

By strengthening future human capital through investment that benefits children and youth, Africa will be able to reap a faster, deeper and longer dividend. If Africa misses this opportunity, population growth could lead to rising poverty, marginalization and instability. Inaction will result in an unprecedented burden, as the continent will need to cope with the exponentially rising demand on natural resources while attempting to meet the needs of billions of inhabitants.

To reap a demographic dividend, Africa will need a blend of political will, sound strategies, enhanced implementation capacity and adequate financing. Employment opportunities will have to address the global rise of artificial intelligence and automation. Despite these challenges, attaining a demographic dividend is possible. A number of Asian countries have already benefited enormously, and their starting points were similar to those currently experienced by the majority of African countries. The challenges across Africa can and must be met to secure its future, and make the continent safe, secure, prosperous and equitable for its most precious asset: its children and youth.
Considerable gains have been achieved for Africa's children in recent years but extensive challenges remain.

### Recent gains

Advances in quality primary health care, access to improved water and sanitation, better education, and increasing empowerment of girls and women have contributed to development in Africa.

- **Under-five mortality dropped**
  - From **1 in 6** in 1990 to **1 in 14** in 2016.

### Challenges

Considerable challenges remain for Africa’s children.

- Closing gaps by investing in essential services is the first step toward ensuring an equitable future for all.

- **More than 50%** of the world’s under-five deaths now occur in Africa.
  - Without accelerated progress, this share will rise to around 60% by mid-century.

- **Africa needs** **5.6 million** more professional health workers to meet the WHO minimum standard of health service provision by 2030.

- **Africa needs** **5.8 million** more primary school teachers to match the pupil-teacher ratio of best sub-regional performers by 2030.

### Health Services

- **50%** of all births in Africa now have skilled attendants present.

### Education

- Since 1990, the number of children with access to primary education in Africa has more than doubled.
Recent gains

- From 2000 to 2015, the number of Africans with access to basic drinking water services increased by 77%.

- The percentage of working women in sub-Saharan Africa has slowly risen from 60% in 1990 to 65% in 2016.

- Child marriages in Africa are decreasing from 44% in 1990 to 35% in 2015.

- Over 60% of Africans do not have access to basic sanitation, with large gaps between rural and urban communities.

- In 2016, 26% of all women of childbearing age have an unmet need for family planning.

- In sub-Saharan Africa, birth registration rates are below 50%, this is 9 percentage points higher than the global average.

- Among the poorest households, it is less than 30 per cent.

Challenges

- Over 60% of Africans do not have access to basic sanitation.

- In 2016, 26% of all women of childbearing age have an unmet need for family planning.

- In sub-Saharan Africa, birth registration rates are below 50%, this is 9 percentage points higher than the global average.

- Among the poorest households, it is less than 30 per cent.
Half of the world’s children will be African by the end of the 21st century

→ Africa’s child population is set to expand steadily for the remainder of the century, in contrast to declines or stagnation in the child population of other continents. The demographic transition continues a trend that has seen Africa gaining an increasing share of the world’s child population. In 1950, Africa had just above 10 per cent of the world’s children. By 2100, if current trends persist, around 50 per cent of all the world’s children will be African.

By 2030, the end year for achieving the 2030 Agenda for Development, Africa’s under-18 population is projected to increase by around 170 million, reaching a total of 750 million. By mid-century, around 42 per cent of the world’s births, 41 per cent of all under-fives, 38 per cent of all under-18s, and 36 per cent of all adolescents will be African – all slightly higher than foreseen in the first edition of Generation 2030 Africa released in August 2014 (all population projections are based on World Population Prospects, by the United Nations Population Division, which is updated every two years).

Almost 1 billion children will live in Africa by mid-century

→ Africa’s child population will increase by two thirds between 2016 and 2050 and reach 1 billion by 2055, representing around 40 per cent of all children globally. By 2100, almost 1.2 billion children will live in Africa.

In one third of Africa’s countries, children already represent more than half of the total population

→ Globally, Africa is the continent richest in children: 47 per cent of Africans are currently under the age of 18. Children are the defining age group of the continent’s population: among AU Member States, one third (17 countries) have populations in which children under 18 years of age comprise the majority of citizens.

One quarter of the world’s population will be African by 2050

→ The increase in Africa’s child population, together with declining child mortality and increased longevity, will bring a marked increase in the continent’s population this century, which is projected to double, from 1.2 billion in 2016 to 2.5 billion in 2050, and rise further to 4.5 billion by 2100, according to current projections by the UN Population Division.

→ This expansion stands in sharp contrast to demographic trends elsewhere in the world, where populations are often shrinking and aging. Based on current trends, within approximately 35 years one of every four people in the world will be African; the figure will rise to 4 of every 10 by the end of the century.

Births will drive Africa’s population expansion, with almost 2 billion babies projected to be born on the continent between 2016 and 2050

→ Fertility rates in Africa remain far above the global average. In 2016, each African woman of reproductive age (15-49 years) had, on average, 4.5 children – compared to the global average of 2.5. Niger continues to have the highest total fertility rate of any country in the world, with a national average of 7.2 children per woman. And while fertility rates are falling across the continent – in some countries sharply – they are projected to remain much higher than the rest of the world in the coming decades.

→ High fertility rates are one of the drivers of the large increase in the number of babies being born in Africa. Others include the rising number of women of reproductive age and improved child survival rates. Elevated fertility rates in Africa in recent decades have rapidly increased the number of women of reproductive age – from 54 million in 1950 to 290 million in 2016. This figure is projected to more than double, to 640 million, by 2050.

→ In 2016 around 42 million babies were born in Africa, 31 million more than in 1950. The cumulative impact of high fertility rates and increased numbers of women of reproductive age will expand births sharply in coming decades, even as fertility rates decline. It is estimated that by mid-century 42 per cent of the world’s births will take place in Africa. Between 2016 and 2050, 1.8 billion births are projected to take place on the continent.
Considerable progress has been made in child survival, but child mortality rates remain high

- Survival rates for children have improved dramatically in Africa: the continent has more than halved its under-five mortality rate since 1990. Progress has been particularly rapid since 2000, although some countries made significant advances while others made less progress.
- In Africa, 1 in every 14 children still dies before the age of five. Progress on under-five mortality has been faster elsewhere, so the continent now accounts for more than 50 per cent of the world’s annual under-five deaths. This share has risen steadily in recent years, and is projected to rise to around 60 per cent by the middle of the century if current trends continue.

Within a decade, Africa’s newborns will have an average life expectancy of 65 years

- By 2026, Africa will have its first generation of newborns with an average life expectancy of the pensionable age of 65 years. This will represent a remarkable feat, given that in 1950 life expectancy at birth in Africa was below 40 years – about 30 years less than in the more developed regions of the world at that time.
- Today, average life expectancy at birth in Africa is 62 years, four years higher than that cited in the first Generation 2030 Africa report in 2014, but still 10 years below the global average.
- The implications of longer life expectancy are important. Given that people in Africa are living much longer than before, the continent will have to begin to find institutional mechanisms to look after its growing elderly population, at the same time as the numbers of its young dependents continues to expand. This dynamic reinforces the continental imperative to reap a dividend from its demographic transition.

Africa will become an urban continent within the next 20 years

- Africa is rapidly becoming an urban continent: 41 per cent of its population currently lives in cities, compared to just 14 per cent in 1950. By the late 2030s, the majority of Africa’s population will live in urban areas and by 2050, almost 60 per cent of Africa’s population will be urbanized.
- Africa will have a diverse range of urban dwellings, from small cities and settlements to vast megacities. The growth in the continent’s megacities will rival that of Asia, with the largest city in Africa, Al-Qahira (Cairo), seeing its population swell from 19 million in 2016 to 25 million by 2030. Lagos, currently the second largest city on the continent, will see its population rise 1.8 times by 2030, from 13 million in 2016 to 24 million.
- Urbanization in Africa poses opportunities as well as risks for children. Africa is urbanizing at an aggregate lower per capita income than China and India did, leaving its urban inhabitants with far lower purchasing power. There is also increasing evidence that Africa’s urbanization is occurring in a more fragmented way. Spatial fragmentation often leads to higher living costs for workers and households, resulting in indirect costs and other constraints for employers. A 2017 study found that African cities are 20 per cent more fragmented than is the case in Asia and Latin America.

Conflict and fragility continue in almost half of Africa’s nations

- Conflict and fragility continue to undermine human rights and social and economic progress in a number of African countries. Of the 36 countries classified in 2017 by the World Bank as affected by fragility, conflict and violence, 21 are African. These 21 countries are home to around 24 per cent of the continent’s population.
- Almost 3 of every 10 African children live in these 21 countries, a total of 153 million children. These countries also account for one third of all under-five deaths in Africa.
- Africa represents 43 per cent of out-of-school children from primary and lower secondary education in countries affected by conflict.

Notable gains have been made in fighting poverty in Africa, but almost half of the continent’s children still live in extreme poverty

- About 40 per cent of the African population survives on less than US$ 1.90/day, the World Bank’s threshold for extreme poverty.
- Fertility is highest among the poorest African communities. In the Democratic Republic of the Congo, for example, women in the lowest wealth quintile had an average of 7.6 children, 2.7 more than in the wealthiest quintile in 2014. Similar trends are prevalent in other African countries.
EXECUTIVE SUMMARY

Special attention is required for Nigeria, given the projected increase in births and child population: by 2050, 1 in every 13 births globally will take place in Nigeria.

- Nigeria currently accounts for nearly 20 per cent of all of Africa’s births and 5 per cent of the global total. Between 2016 and 2030, 120 million births will take place in Nigeria alone — more than all the births in Europe — accounting for 6 per cent of the global total for that period. Based on current projections, by 2050, 1 of every 13 births globally will occur in Nigeria.

Smaller African nations with the highest fertility rates will also require particular attention and investment.

- Niger has the world’s highest fertility rate, at 7.2 children per woman, followed by Somalia, with 6.3 children per woman. Even after taking into account the expected decline in fertility rates, these two countries will have among the highest birth rates in Africa in 2050: 4.6 children per woman in Niger and 3.7 in Somalia.

- High fertility rates in Niger will result in the world’s largest percentage increase in number of births. Niger currently has 1 million births per year, which is expected to more than double, to 2.4 million births, by 2050. As this report highlights in Chapter 2, the gaps in international benchmarks for maternal, newborn and child care need to be addressed in order to accommodate the projected increase in births and prevent African countries with high fertility rates from falling further below these benchmarks.

- Increased fertility rates and improved child survival rates in Niger and other African countries with high fertility rates will swell these countries’ populations. Niger’s population is projected to triple, from 21 million in 2016 to 68 million by mid-century and soar to 190 million people by 2100.

Continuing population growth will pose a challenge to Africa’s health and educational infrastructure.

- Today, Africa requires over 3 million additional professional health workers to meet the WHO minimum benchmark of 4.45 doctors, nurses and midwives per 1,000 population. Only five of Africa’s countries currently meet this threshold.76 By 2030, Africa will require around 5.6 million more health workers than it currently has to meet WHO standards. But if current trends in the numbers of skilled health personnel continue, the continent will add only 1.4 million health workers by 2030, leaving a gap of around 4.2 million.

- Similar trends are prevalent for other social welfare infrastructures, such as the number of hospital beds, social workers, community health workers and school teachers. The number of primary school teachers, for example, will need to more than double by 2030 just to maintain the current primary school enrolment rate. Attaining the pupil-teacher ratio of the best-performing country in each sub-region will require more than 5.8 million additional primary school teachers by 2030.18

Opportunities exist for Africa to reap a demographic dividend: with appropriate investments in human capital and policies to stimulate job creation, per capita incomes in Africa could quadruple by mid-century.

- The DemDiv model, a simulation tool devised for policy makers, was used to simulate the benefits of Africa’s potential demographic dividend. It becomes clear that AU regions could expect to see per capita incomes increase by up to four-fold if they invest in human capital and social and economic infrastructure. This, in turn, could lift millions out of poverty and create the conditions for lasting prosperity and increased stability.

- Considerable work must be done to attain the dividend. Major investments in access to quality health care and education, culturally sensitive reproductive health services, technology, budget transparency and good governance are all urgently required to set the foundation for the demographic dividend and keep pace with the continent’s demographic transition.
Opportunities exist for Africa to reap a demographic dividend during the 21st century. Analysis shows that the continent as a whole could quadruple its per capita income by 2050.

→ Africa will need to massively and rapidly scale up its investment in children and youth if it is to have a chance to seize the demographic window of opportunity — and time is running out. By 2030 the demographic window will close for a number of African countries, and by 2050 only those countries which are in the pre- or early dividend stage will still have an opportunity to reap a demographic dividend.\(^{20}\)

→ The first step to securing a demographic dividend is for countries to establish robust social systems to withstand shocks and stresses and which enable them to advance toward a demographic dividend. Africa faces the challenge of adding some 5.6 million health workers and 5.8 million teachers by 2030 to meet international standards in health care and regional best performance in education, laying the groundwork for a demographic dividend in the remainder of the century.

→ The demographic dividend also relies heavily on the extent to which policies and relevant actions are geared toward strengthening the human capital base. If Africa continues past trends in investment in education and the economy, the DemDiv model projects that the continent as a whole will experience annual gross domestic product (GDP) growth of 1.9 per cent over the next 35 years. Africa can increase this rate to 2.4 per cent annually by strengthening educational policies and increasing school attendance and mean years of schooling. Furthermore, if Africa combines investment in education with economic policies related to labour market flexibility, information and communications technology, and financial and trade openness, average per capita growth rate could reach as high as 5.2 per cent for the entire region by 2050 (with variations between 4.5 to 5.8 per cent across sub-regions).

Africa’s child population will reach 1 billion by 2055 and will become the largest of all continents in the latter part of the 21st century

Fig. 1.1 Children under 18 and total population in Africa, 1950–2100 (in millions)

Africa’s children make up almost half its population and their numbers will reach 1 billion by 2055

Children lie at the heart of Africa’s present and future. Children under 18 currently comprise 47 per cent of Africa’s overall population. In 17 countries – almost one third of the African Union’s 55 Member States – more than half of the population is under 18 years of age. These figures contrast sharply with the share of children in the total population of Europe (19 per cent), North America (22 per cent) and Asia (29 per cent). However, despite the large increase in Africa’s child population, Asia’s overall child population remains the most sizeable of any continent.

Note: The horizontal lines for each are proportional to the number of inhabitants.
Africa can expect to witness a surge of around 170 million in its child population by 2030

FIG. 1.2 A Share of children under 18 by major region, 1950–2100 (per cent)

170 million increase
48 million decrease

FIG. 1.2 C Children under 18 by major region and by world, 1950–2100 (in millions)

The scale of Africa’s projected child population growth is unprecedented

Historical comparison puts the scale of Africa’s child population growth in perspective (see Figure 1.2 C). In 1950, Africa’s child population, at 110 million, was around two thirds the size of Europe’s, one fifth the size of Asia’s and one ninth of the world’s total. By 2016, Africa’s child population was already four times larger than Europe’s and approximately a quarter of the total world child population. By 2030, it will be five times larger than Europe’s, rising to seven times greater by 2050, when the continent’s child population is set to reach almost 1 billion and account for nearly 40 per cent of the world’s children. Five years later, in 2055, Africa’s child population will reach 1 billion, and will surpass Asia’s child population before the end of the 21st century.

The child population in Africa is rapidly rising at a time when other continents are seeing steady and significant declines in their child populations. Over the course of the 2030 Agenda for Development, also known as the Sustainable Development Goals, the world’s child population is set to see a net increase of around 122 million. Africa’s child population alone will increase by about 170 million between 2016 and 2030. This increase will fully offset a 48 million net reduction in the child population in the rest of the world, mainly Asia, Europe and Latin America (see Figure 1.2 B).

Births in Africa have almost quadrupled since 1950, and are set to rise by one quarter by 2030 and one half by 2050

**FIG. 1.3 A** Cumulative number of births in Africa, selected periods (in billions)

**FIG. 1.3 B** Number of births by region, 1950–2100 (in millions)

**FIG. 1.3 C** Share of births by region, 1950–2100 (per cent)

Increasing numbers of women of reproductive age and high fertility are driving Africa’s burgeoning child population

Child population growth depends on two key factors: the number of women of reproductive age and births per woman. Owing to still high, though steadily declining, fertility rates and a high share of women of reproductive age in the population, Africa’s births continue to increase. Africa will see 730 million births between 2015 and 2030 and around 1.8 billion births between 2015 and 2050. By the middle of the century, Africa will account for 42 per cent of all global births, almost the same share as Asia (43 per cent), although the latter’s share of the world’s total is on a sharp downward trajectory.

Between 2010 and 2015, adolescent girls aged 15–19 gave birth to 14 per cent of all babies in Africa, two times more than adolescent girls in Asia. Adolescent girls in Africa also have the highest rates of fertility for their age cohort in the world, with 99 births per 1,000 adolescent girls, compared to the average of 46 at the global level. Seventeen countries in Africa had 120 or more live births per 1,000 adolescent girls aged 15–19. Among Africa’s sub-regions, adolescent fertility rates were highest in Central and Western Africa and lowest in Northern Africa.

Child survival in Africa as a whole has improved markedly since 2000

**FIG. 1.5** Under-five mortality rate (deaths per 1,000 live births) by African Union region, 1990–2016

Within Africa, there has been a major shift in the demographic composition of the sub-regions

Between 1950 and 2016, Southern Africa has maintained its share of Africa’s births, and this status is expected to carry through to the end of the century. The share of births for Northern Africa has shrunk since 1950 and this sub-region’s share of the continents’ total births is projected to continue to decrease. Western Africa’s share has increased since 1950 and is projected to continue to do so through to the end of the century. Together with Eastern Africa, these two sub-regions currently constitute over 50 per cent of the continent’s births, and by the end of the century will be responsible for around two thirds of all births on the continent.

Globally, almost two thirds of women of childbearing age who are in a union now use contraception. In Africa, this proportion drops to a third of such women and to around 20 per cent for those in Western Africa. Globally, in 2016, 17 per cent of all women of childbearing age are estimated to have an unmet need for family planning; for the African continent, this proportion rises to 26 per cent.

Despite stark improvements in child survival, child mortality remains high

Africa’s children have a better chance to survive and thrive than ever before. The 1980s and 1990s saw a large increase in births and a decline in mortality rates. But mortality rates were unable to outpace increased population growth, resulting in a rise in the numbers of under-five deaths. The late 1990s and subsequent decades have seen steady reductions in under-five mortality across the continent. In 1990, more than one in every six African children died before their fifth birthday. By 2016 this ratio had fallen to 1 in every 14 children.

The average under-five mortality rate for sub-Saharan Africa has fallen sharply since 1990, from 181 deaths per 1,000 live births to around 78 per 1,000 in 2016 – a 57 per cent decline. Progress has been particularly marked since 2000. Although under-five mortality rates in the region are still high, and far higher than for other continents, this shows that notable advances can be attained within a generation.

Africa has seen almost a doubling in life expectancy since the 1950s, and within a decade will have its first children born that, on average, can expect to live at least to the pensionable age of 65.

*FIG. 1.6 Life expectancy by region, 1950–2100*

Today, a child born in Africa can expect to live for 62 years: by 2030, life expectancy will have increased to 65.

As child survival rates have increased in Africa, so too has life expectancy for the continent’s newborns. In the 1950s life expectancy in Africa was 36 years, 28 years less than for high-income countries and 10 years less than the world average. Since then, Africa has seen a steady increase in life expectancy. A newborn in Africa today can expect to live until almost 62 years of age. Based on current trends, within a decade Africa will have its first generation of newborns who can expect to reach pensionable age, as life expectancy at birth will reach 65 years of age for the first time.

Life expectancy in Africa still lags behind that of other regions – by around 10 years compared to the world average, and almost 20 years compared to that of high-income countries. But the gap is closing rapidly, and will narrow to six years compared to the world average and 14 years compared to high-income nations by 2050.

**Note:** The national income classifications follow the World Bank income classification, 2017.

Positive trends in access to and utilization of health care, nutrition and water, sanitation and hygiene are driving Africa’s child survival enhancements

FIG. 1.7 Trends in selected indicators for health care, nutrition, water and sanitation in Africa, 2000 and 2015

**Health**
Coverage of the third dose of diphtheria-tetanus toxoid and pertussis (DTP3) vaccine among children under 1 year

**Nutrition**
Children under 5 not stunted

**Water**
Population with at least basic drinking water services

**Sanitation**
Population with at least basic sanitation services

Better access to health care, water and sanitation, education and protection and the empowerment of girls and women have together fuelled gains in child survival and development

The marked advances in child survival since the late 1990s are the product of concerted efforts by national and international partners to prioritize child survival interventions, especially in sub-Saharan Africa. The following factors have played a key role in improving gains in Africa’s child survival: better access to quality health care, nutrition and environmental health services; enhanced access to education; and increased empowerment of girls and women.

Recent decades have seen marked successes in expanding coverage of essential services. The majority (80 per cent) of pregnant women in Africa now receive at least one antenatal care visit. More than half (58 per cent) of all births in Africa in 2015 were assisted by skilled health personnel. Almost three out of every four infants on the continent receive their third dose of diphtheria-tetanus toxoid-pertussis (DTP3) vaccine. The population in Africa with access to basic drinking water services more than doubled, from 427 million (52 per cent of the population) in 2000 to 756 million (63 per cent of the population) in 2015.

In the education sector, Africa has also seen pronounced progress. Gross enrolment rates in pre-primary education have more than doubled, from 16 per cent in 2000 to 33 per cent in 2015. The percentage of primary-school-age children with access to primary education increased from 64 in 2000 to 80 in 2015. And the gender parity index for primary education enrolment has improved in all of Africa’s sub-regions, from 0.90 in 2000 to 0.95 in 2015. Relative improvements in secondary net enrolment rates have been even greater, increasing by 11 percentage points, from 28 per cent in 2000 to 39 per cent in 2015. In 2050, a recent study estimated that one in three children in Africa may not be able to complete secondary education, and higher educational opportunities might be available to only 5 per cent of the school graduates in some African countries while it is estimated to be as high as 80 per cent in some countries in East Asia.

It is a similar story at the tertiary level, where access has increased from 8 per cent in 2000 to 13 per cent in 2015, with a considerable improvement in the gender gap, from 0.75 to 0.86. However, access to tertiary level education remains extremely low by global standards and a significant gender gap still persists.

*Note: Unlike in primary and secondary education, where the target age groups consist of the official school age populations, the notion of a target population does not readily apply to tertiary education as there are usually no official ages for attendance. Most tertiary education systems offer a wide range of programmes and pathways, allowing students to achieve a degree in just two years or to complete an advanced research degree in seven or eight years. In light of this variation, the gross enrolment ratio (GER) for tertiary education is calculated on the basis of a standard age range of five years that begins at the end of secondary education. The tertiary GER is a useful measure to compare the volume of participation in tertiary programmes. However, it is important to note that there are limitations when comparing the actual population coverage across countries due to the diversity in the duration of tertiary programmes, the enrolment of large numbers of women and men outside the target age group and the high levels of drop-outs and frequent re-enrolments. UNESCO Institute for Statistics, Global Education Digest 2009 (2009).*
Child marriage is edging downwards, but more than one third of young African women were married while they were still children

FIG. 1.9 Percentage of women aged 20 to 24 years who were first married or in union before age 18, by African Union region, 1990–2015

Progress can also be seen in the protection and empowerment of girls and women

Africa’s rates of child marriage have edged downwards from 1990 when approximately 44 per cent of women aged 20–24 reported having been married before age 18, to around 35 per cent in 2015. Northern Africa has a low prevalence of child marriage, with under 15 per cent of women aged 20–24 reported to having been married before age 18 in 2015, while all other sub-regions have prevalence rates of 35 per cent and above; the highest, over 40 per cent, occurs in Western Africa.

Note: Aggregates are based on data from 45 countries representing 90 per cent of the female population in Africa. Aggregates by sub-region represent at least 50 per cent of the regional female population.

Source: UNICEF global databases, 2017, based on Demographic and Health Surveys (DHS), Multiple Indicator Cluster Surveys (MICS), and other nationally representative surveys, 2010-2016.
Women’s participation in the labour force in Africa has also continued to rise, from 51 per cent in 1990 to 55 per cent in 2016. While still well below rates in other regions, in sub-Saharan Africa 65 per cent of women of the working age population were engaged actively in the labour market in 2016, up from 60 per cent in 1990.36 Furthermore, the representation of women in parliament has climbed from 10 per cent of Africa’s parliamentarians to around 23 per cent between 2000 and 2016, although there is considerable variation among the sub-regions.37

Women now account for almost a quarter of Africa’s parliamentarians, up from one tenth in 2000

FIG. 1.10 A Proportion of seats held by women in national parliaments by Africa in total and by African Union region, 2000 and 2016 (per cent)

FIG. 1.10 B Proportion of seats held by women in national parliaments in Africa, 2016 (per cent)

Source: United Nations, Department of Economic and Social Affairs, Statistics Division, ‘SDG Indicators Global Database: Indicator 5.5.1 – Proportion of seats held by women in (a) national parliaments and (b) local governments’, UNSD, New York, 2017.
Large gains in access to water and sanitation in Africa are outweighed by population growth, leaving an increased number of people without access in 2015.

FIG. 1.11 A Population with and without at least basic sanitation services by African Union region (in millions)

FIG. 1.11 B Population with and without at least basic drinking water services by African Union region (in millions)

Extensive challenges remain for every aspect of child survival and development.

Despite these gains, extensive challenges persist in each of these areas. Faster progress in other continents has left Africa with more than half of the world’s under-five deaths, and projections suggest that its share will continue to increase in the coming years as mortality levels remain comparably high and births fall, or remain at current levels, in the rest of the world and continue to rise in Africa. The continent is also home to over half of the world’s children of primary school age who are out-of-school.

While most pregnant women in Africa have one antenatal visit, only 53 per cent have the four visits recommended by the World Health Organization. Although Africa experienced a 16 per cent reduction in stunting prevalence among children under five since 2000 – from 38 per cent in 2000 to 32 per cent in 2015 – there was a net increase of 16 per cent – or just over 8 million – in the number of stunted children on the continent, as a result of the rapidly increasing child population.
Gaps in environmental health remain stark: four out of 10 of Africans lack access to basic water services and six out of 10 to basic sanitation, with large gaps between rural and urban communities, and within urban areas. And while significant numbers have gained access to basic drinking water since 2000, population growth has resulted in a rise in the numbers of Africa’s population that do not have access to this vital resource: from 391 million in 2000 to 438 million in 2015.

In Africa, only 38 per cent of the population uses an improved sanitation facility that is not shared with other households, while the population with limited or no access grew by 212 million, despite 165 million people gaining access since 2000.

In education, despite significant progress much remains to be done. Only one out of five countries in Africa have achieved, or are near the achievement of, universal primary education (over 90 per cent primary completion rates). And many African children who enrol in and attend school fail to complete a full primary education and to master basic literacy and numeracy skills.

Rates of enrolment in secondary and tertiary education remain among the lowest in the world: only 39 per cent of Africa’s secondary school age children attend secondary school, and just 13 per cent of Africa’s adolescents and young adults advance to tertiary education.

Harmful traditional practices, such as child marriage, remain prevalent. Estimates from 2010-2016 indicate that more than one third of young women in Africa were married before the age of 18. Countries with high levels of early marriage tend to have high levels of early childbearing and high fertility levels, perpetuating the cycles of poverty and inequality.

In sub-Saharan Africa, the average level of birth registration remains below 50 per cent, and is well below that in a number of countries. Despite some progress, most women have only a marginal role in the formal labour force and local and national decision making processes.

Children are more affected by extreme poverty than adults in sub-Saharan Africa. While 38 per cent of adults in sub-Saharan Africa live in extreme poverty, the share increases to 49 per cent among children.

Many of the indicators discussed above are related to multi-dimensional development. Taken together, it is clear that many African countries – and particularly the poorest communities – are experiencing multiple dimensions of poverty. In addition, monetary poverty rates are also elevated (see Figure 1.12A and B). According to a recent study by the World Bank and UNICEF, sub-Saharan Africa has both the highest rate of children living in extreme poverty (defined by the World Bank as those living on less than US$1.90/day) – at just under 49 per cent – and the largest share of the world’s extremely poor children, at just over 51 per cent. Since 22 countries without data were not represented in the analysis, the real share could be even higher.

Notes: Fig. 1.12 A) Extreme poverty child headcount ratio is defined as share of children with household per capita income or consumption less than $1.90. Sub-Saharan countries are covered. The risk of an African child living in poverty and extreme deprivation deepens markedly in situations of fragility

Around one quarter of Africa’s children – 153 million – are currently living in situations of fragility or conflict.54 Of the countries included in UNICEF’s 2017 Humanitarian Action for Children appeal, 85 per cent are in Africa.55

Note: “Fragile Situations” refer to the World Bank ‘Harmonized List of Fragile Situations FY 18’. Fragile Situations have, either (a) a harmonized average Country Policy and Institutional Assessment (CPIA) country rating of 3.2 or less, or (b) the presence of a UN and/or regional peace-keeping or peace-building mission during the past three years. For further details of this classification please refer to http://pubdocs.worldbank.org/en/189701503418416651/FY18FCSLIST-Final-July-2017.pdf.

Millions of children in Africa are affected by climatic conditions such as drought

FIG. 1.14 Children in Africa by drought severity, 2015 (in millions and percentages)

It is increasingly recognized that the natural and physical environment in which a child lives strongly influences his or her wellbeing. Recent reports by UNICEF indicate the extent of these linkages. Among continents, Africa currently has the highest number of children living in areas prone to high or extremely high drought severity: 84 million, or 15 per cent of the continent’s child population. More than 350 million African children live in homes where solid fuel is used, significantly increasing their health risks from indoor air pollution. As Africa’s cities rapidly expand, outdoor air pollution is also becoming a threat to children’s health across the continent.

These challenges risk being amplified by population growth unless efforts for child survival and development and women’s empowerment accelerate

All these challenges risk being exacerbated by rapid population growth. As explained in Chapter 3, massive investment is required to meet the deficits in health care and education services required to strengthen the continent’s human capital and prepare it for reaping a demographic dividend later in the century. Of equal importance is the need to plan for the spatial and infrastructural implications of a doubling of the continent’s overall and child populations by mid-century. There is also an urgent imperative to plan for the needs of the almost 170 million children that will be added to the continent’s population over the course of the 2030 Agenda for Development, and to prioritize the most disadvantaged and marginalized children, whose access to essential services and protection is often well below many of the aggregates cited here.

The 2030 Agenda for Development, the recently adopted Africa’s Agenda for Children 2040 and the African Union Agenda 2063 present opportunities for intensifying the discourse around investments in children and youth and accelerate progress on social, economic and environmental development. Given the continent’s rapid demographic transition and the sheer scale of its projected population increase, failure to do so may leave Africa even further behind other regions, and lacking the conditions to reap a demographic dividend in the middle and second half of the century.
Chapter 2

CLOSING GAPS IN AFRICA’S SOCIAL SYSTEMS TO REAP THE DEMOGRAPHIC DIVIDEND

Aisha Abdoulaye stands in the fish market where she works, in the conflict-affected city of Gao, Mali

© UNICEF/UNI139683/Bindra
CLOSING GAPS IN AFRICA'S SOCIAL SYSTEMS TO REAP THE DEMOGRAPHIC DIVIDEND
Planning is critical if Africa is to reap the benefits of a potential demographic dividend

Much has been written in recent years about Africa’s potential to reap a demographic dividend. This important issue was chosen as the African Union’s theme for 2017, with a major focus on investing in youth. This chapter explores Africa’s potential for investing in children to build a strong human capital base. The analysis presented suggests that Africa has the potential to reap such a dividend, particularly towards the middle of the century, as its demographic transition will result in a youthful working age population that – if healthy, educated, empowered and protected – can drive economic growth higher than ever before. But the dividend is far from guaranteed, and requires countries to make judicious investment now and in the future in social systems to strengthen their human capital bases.

The term ‘demographic dividend’ refers to potential economic growth resulting from the presence of a proportionally larger working age population. It is driven by a country or region’s demographic transition. As mortality and fertility decline, the age structure of the population changes. With fewer births each year, a country’s young, dependent population grows smaller in relation to those of working age. During such periods the dividend can materialize: the increasing share of the working age population compared to other age groups leaves each working age person with fewer dependents to support, and thus with more disposable income. This, in turn, can spur greater consumption, production and investment and accelerate growth. The window for demographic dividends eventually closes when the dependency ratio rises again as a consequence of population ageing: the increasing share of the elderly population and continuing low fertility feed declining numbers of new cohorts to the working-age population.

But even with optimal demographic conditions, a dividend is not guaranteed. It requires a country to have educated and trained human resources and to pursue economic models capable of productively employing the surging workforce.

Most countries in Africa are in the pre-dividend phase

Proximity to the demographic window of opportunity is defined in this report according to a typology devised by the World Bank, based on current and past fertility and changes in the share of the working age population. Countries are either pre-dividend (yet to reach the window), early dividend, late dividend or post-dividend. For the latter, demographics can no longer play a part in spurring economic growth. And although much has been written about Africa approaching a demographic dividend, for more than half of its nations the demographic window of opportunity is relatively far away and may only emerge towards the middle of the century. This calculation is based on current trends in fertility and population growth, when the dependency ratio (defined as the number of children aged 14 years and younger) and elderly (aged 65 years and older) per 100 working age population (15 to 64 years), is approaching its lowest value (see Figure A.2). Between now and 2030 Africa’s population will grow from 1.2 billion to 1.7 billion, but its structure will not change substantially, remaining one with a young and growing population (see Figure A.3).

Only four of Africa’s countries are classified as ‘late dividend’ according to the World Bank demographic typology (Mauritius, Morocco, Seychelles and Tunisia), while 14 are identified as ‘early dividend’ (Algeria, Botswana, Cape Verde, Djibouti, Egypt, Gabon, Ghana, Lesotho, Libya, Namibia, Rwanda, South Africa, Swaziland and Zimbabwe). The other 36 are all at the pre-dividend stage, and will not reach their demographic window of opportunity until 2030 or beyond.

Given that all but four African states are at the pre- or early-dividend stages, investing in Africa’s children to reap the dividend becomes all the more imperative. While the current generation of African youth will have much to contribute to a potential demographic dividend, for many of the continent’s countries the children of today and tomorrow will be key to its fulfilment – for it will be after 2030 when the demographic window of opportunity is open to most countries. Development forums in Africa and globally therefore have to intensify the discourse around investments for Africa’s children, to ensure that the continent is in a position to seize the demographic window of opportunity that is approaching for the majority of its countries.
Hawa Kargbo, 64, with her son’s children outside her home in the village of Mateneh, Bombali district, Sierra Leone
Enhancing Africa’s human capital will require closing gaps in the continent’s social systems

Reaping a demographic dividend in Africa will necessitate constructing a firm foundation through investment in building the continent’s human capital. This will give African countries great flexibility when choosing appropriate economic models to employ its burgeoning workforce in coming years. But many countries on the continent still lack adequate investment in fundamental institutional structures to build this human capital, particularly given the projected growth of their child and youth populations.

A gap analysis of Africa’s social systems can be used to identify the potential investment required for individual countries to build a strong human capital base. Data on social systems remain somewhat sparse and incomplete, owing in part to the difficulty of standardizing indicators across countries. Available data, however, provides some insights into the strength of social systems in health and education, particularly in relation to international standards.

The World Health Organization (WHO) has set out minimum standards for key interventions in health, such as the requisite ratio of skilled health personnel per 1,000 inhabitants. These standards represent a concrete milestone for assessing whether a health system is sufficiently robust to deliver results and withstand shocks. The Ebola crisis in 2014-2015 illustrated the utility of such measures. The three countries most affected – Guinea, Liberia and Sierra Leone – had health system indicators well below minimum WHO standards. Ensuring that all African countries achieve minimum standards for health care is a key first step towards establishing the foundation for the continent to reap a demographic dividend later in the century.

Considerable divergence can be seen among Africa’s sub-regions and countries in relation to the strength of their health systems. None of the five sub-regions has met most of the WHO’s minimum standards for healthcare, and although Northern and Southern Africa are the closest, they still fall short of the standards by around 80 per cent. Most countries in the other three sub-regions – Central, Eastern and Western Africa – have an even longer way to go to meet these thresholds.

Minimum standards are less developed or agreed upon for education. One way of undertaking a regional-level gap analysis is therefore to see how countries measure up to the leading regional performer, and assess the extent of gap reduction required to boost all countries to that level. The education gap analysis presented here is based on this methodology.

Bringing Africa’s health care and education to international standards will go a long way toward laying the groundwork for a demographic dividend

The next section examines the gaps in key indicators for health services and education. This limited set of indicators represents those that are available for the broadest group of African countries. As such, the findings paint only a partial picture of the continent’s health and education systems – and critically, do not address the quality of service provision, for which there is not yet an agreed set of indicators. But, even given these limitations, the figures underscore the urgent need for more and better investment in Africa’s social systems.

A key reason for undertaking a gap analysis in health care and education is to form a baseline for the extent of investment required to catalyse a demographic dividend for all of Africa, taking demographic changes into account. Much has been said about the possibility of achieving this dividend, and some useful studies undertaken. Most agree that a dividend is possible, but advocate for considerable investment in the human capital required and the application of appropriate economic models to absorb and productively employ the surging workforce.
Africa will need an additional 4.2 million health workers above its current rate of growth to meet the WHO minimum standards for frontline skilled health personnel by 2030

FIG. 2.1 Number of health service providers (doctors, nurses and midwives) for each scenario by Africa in total (in millions) and by African Union region (in thousands)

Africa is on course to add 1.4 million more health workers by 2030, but will need to employ an additional 4.2 million skilled health professionals to meet minimum WHO standards, due to the growing population.

Doctors, nurses and midwives provide the core frontline skilled personnel for health systems. WHO standards call for a minimum of 4.45 doctors, nurses and midwives per 1,000 inhabitants. In 2013, the world’s richest countries had a density more than double this threshold (10.4); the highest was Denmark, with 20 skilled health personnel per 1,000 inhabitants. The global average in 2013 was 5.9 per 1,000 inhabitants. For Africa as a whole, this ratio in 2015 was 1.7 per 1,000 inhabitants.

If trends for health personnel during the period 2000-2015 continue, the continent will add 1.4 million personnel to its frontline skilled health professionals by 2030, for a total of 3.4 million. Given Africa's demographic outlook, an additional 4.2 million professionals will be needed for the continent to reach the WHO minimum standard of 4.45 skilled health professionals per 1,000 population, requiring a total of 7.6 million professionals by 2030.

Note: For countries who already have a density of 4.45 the current value is maintained. Data from 2000 to 2015 was used for estimation. No health workforce data were available for South Sudan, hence the subregion’s average density was assumed.

Skilled health personnel need to increase six-fold in Eastern Africa, five-fold in Central Africa and four-fold in Western Africa to meet WHO minimum standards for health service provision by 2030.

Variation among Africa’s sub-regions and countries is significant. Examining sub-regional averages for density of skilled health personnel, both Northern and Southern Africa have densities about twice as large as the other three African sub-regions. Nevertheless, the gap in relation to the WHO minimum standard is still around 80 per cent of the actual numbers. Assuming a continuation of current trends, both sub-regions will fall short of WHO standards by around 450,000 medical staff.

In the other sub-regions, large populations and the low current density of health personnel will present even greater challenges for strengthening health systems. Meeting the WHO standards by 2030 will require increasing the current number of health workers in Eastern Africa by six-fold, five-fold in Central Africa and four-fold in Western Africa. Meeting the WHO standards by 2030 for these three sub-regions will require adding 4.4 million skilled health personnel to the existing 1.1 million health force.

Investment in health sector personnel is essential, given the 730 million babies due to be born in Africa during the 16 years from 2015-2030. At present, only 58 per cent of pregnant women in Africa have their births attended by skilled health personnel – leaving around 17 million births unattended each year. Sub-regional variation is again significant, with 88 per cent and 71 per cent of births attended by skilled health personnel in Northern Africa and Southern Africa, respectively, but only 46 per cent in Western Africa.

Based on current trends of both births and rates of skilled birth attendants in Africa, 21 million births will still not be attended in 2030. When viewed in cumulative terms, the figures are significantly greater: if current rates of coverage persist, then about 310 million births will not be attended by skilled health personnel between 2015 and 2030. Around 80 per cent of these non-attended births will take place in the Eastern and Western Africa sub-regions.

Data and projections related to skilled health personnel and skilled attendance at delivery illustrate the challenges and opportunities for investing in Africa’s children and mothers. They are also based on some key assumption that could modify the projected figures. For example, they do not take into account potential future breakthroughs in technology that could alter the minimum standards required for health systems to be considered as resilient. In addition, many other factors go into making a robust health system, including community health workers, facilities, medicines, administrative capacity, financing and more. The purpose of this section is not to be exhaustive in describing and projecting health system indicators but to illustrate important gaps that must be filled in connection with population growth and to serve as a foundation for the policy recommendations and potential strategies for success outlined in Chapter 3.
In education, Africa faces the challenge of reducing pupil-teacher ratios to improve learning outcomes

Africa has made important strides in increasing access to primary and secondary education in recent decades. But many African countries face challenges in this area, and all need to improve the quality of education services and learning outcomes for all children. The 2017 World Economic Forum report revealed that only five of 25 African countries assessed exceeded the global average for education system quality.

The continent’s demographic dynamics will sharpen these challenges. The period between 2015 and 2030 will see a 33 per cent increase in the primary-school-age population: from 189 million to 251 million. The largest increases will take place in Western and Eastern Africa, with increases of 22 million and 18 million, respectively. Countries in Northern Africa have the highest levels of primary school enrolment and the lowest projected increase in the primary school age population for 2015-2030.

The projected increase in the number of children will necessitate a sharp expansion in both the number of schools and of education personnel to maintain status quo. If the increase in school age population and pupil/teacher ratios in each country are taken into account, by 2030 the primary school teacher pool will have to increase by 1.3 million from its current 5.4 million, based on current enrolment rates. If the objective is to improve the pupil/teacher ratio to equalize it to the best-performing country in each of the five sub-regions (depending on sub-region, between 17 and 23 students/teacher), then the number of teachers would need to increase by 5.8 million, more than doubling the original number.

Like the health gap analysis, findings for education are limited by the lack of data for several African countries. Many other factors also go into building a robust education system, including facilities, supplies, curricula, administrative support, capacity building and financing. And it is difficult to find accurate, reliable data for both primary and secondary education quality. The number of overage children in school further complicates estimates of the actual gap in education. But the findings nevertheless point to the tremendous challenge facing Africa (particularly Central, Eastern and Western Africa), for creating the foundation required to build a strong human capital base.

Meeting minimum standards for health care and rapidly improving education standards will be key to establishing the foundation for a potential demographic dividend. Education and health indicators are also important components of the demographic dividend analysis undertaken in this report, the findings of which are summarized in the next section.
CLOSING GAPS IN AFRICA’S SOCIAL SYSTEMS TO REAP THE DEMOGRAPHIC DIVIDEND

Over the period 1999-2015, Niger achieved the most progress in Africa in improving completion rates for primary education (proxied by gross intake ratio to the last grade). The country’s primary completion rate rose from 20 per cent in 1999 to 69 per cent in 2015, with the greatest progress taking place between 2013 and 2015.82

Many factors have contributed to the rapid improvement in Niger’s primary completion rate, especially the expansion of school infrastructures and expenditures on recruitment of teachers. This, in turn, has enabled the accommodation of increased numbers of children in schools and provided the support to enable them to complete primary education. In the last 10 years, the number of primary schools in Niger has doubled, the number of classrooms is 2.5 times greater than in 2005, and the number of primary school teachers has almost tripled from 24,91 in 2005 to 66,750 in 2015.83 These developments are the result of increased investments in education by the Government and its partners to address the challenges of a rapidly increasing child population and a large number of out-of-school children. The Government of Niger increased education spending from 17 per cent of total government expenditure in 1999 to 22 per cent in 2014, of which half was spent on primary education.84

Nonetheless, quality of education remains a challenge. The 2014 sub-regional learning assessment (PASEC) revealed that less than 7 per cent of the Nigerien sixth-graders were able to attain satisfactory levels in language and mathematics. A focus on improving the quality of education, as well as access and equity, especially for girls and out-of-school children, is a challenge of critical importance for Niger and many other African countries.

More than 11 million primary school teachers will be needed in 2030 to meet the best sub-regional performers’ pupil-teacher ratio

Fig. 2.3 Primary school teachers for each scenario by Africa in total (in millions) and by African Union region (in thousands)

To meet the best sub-regional performer’s pupil-teacher ratio in 2030:

- **Central Africa** will need a total of 1.5 million teachers, or more than double the 2015 number
- **Eastern Africa** will need a total of 3.7 million teachers, or more than 2.5 times the 2015 number
- **Northern Africa** will need a total of 1.8 million teachers, or almost double the 2015 number
- **Southern Africa** will need to more than double the number of teachers
- **Western Africa** will need a total of 2.9 million teachers, or about 1.8 times the 2015 number

Note: For missing values of pupil/teacher ratios in Libya, Sudan and Somalia the sub-regional average was used. Best sub-regional performers’ pupil/teacher ratio: Central Africa - 22; Eastern Africa - 19; Northern Africa - 17; Southern Africa – 23; Western Africa – 22.

BOX 2.3
CONFLICT DELAYS, OR EVEN NARROWS, THE DEMOGRAPHIC WINDOW OF OPPORTUNITY

Conflicts and disasters can have considerable impacts on population dynamics. The impact of crises and emergencies on migration, mortality and fertility is often reflected in the population’s age structure and size. For instance, the proportion of females was much larger in several European countries for cohorts born in the 1920s, following the death of many men during World War II. In today’s rapidly globalizing world with increasing risks and threats – such as complex conflicts and natural disasters – population dynamics are very likely to be affected.

The shortage of vital resources such as drinking water and fertile soil can heighten civil strife and may force people to leave their homes, within or across borders. In particular, as demographic shifts and growing economies and consumption levels are expected to occur in Africa over the coming decades, demand for water will increase substantially, which is likely to be a major driver of water crises in the region. Although shortages in water availability due to growing demand are not directly linked to potential conflict, reducing tensions and improving planning to establish more resilient systems, as well as strengthening the management of scarce resources for growing populations, should be prioritized against the backdrop of changing climate.

If the demographic transition is not considered in development policies and planning, young people are denied opportunities and aspirations. Youth exclusion is a key factor in violent conflict, and studies suggest that countries with a large percentage of young people aged 15 to 24 are at higher risk of low-intensity conflicts such as non-violent protests and riots. Demographic trends alone are not sufficient to explain fragility and violent conflict. Yet where young people face a wide array of development challenges and are victims of discrimination and exclusion, they are at greater risk of being mobilized for violence.

Most importantly, the demographic dividend anticipated in Africa cannot be achieved if fragility and conflict persist at elevated levels. Reaping the demographic dividend depends on a variety of conditions, such as lower fertility rates, longer life expectancy, a healthier population and better education for women. Building resilience through conflict prevention and peacebuilding, risk-informed planning and resilient social systems will be critical for the economic and social prospects of young people in Africa.

Simulations with the DemDiv model show that strengthening its human capital through education and improving key economic variables, Africa has the potential to substantially increase per capita income in the coming decades.

Simulation models can be used to demonstrate how investments in health, education and the economy can help countries to attain a demographic dividend. This report uses the DemDiv modelling tool developed by the Health Policy Project at the Futures Group, with support from the U.S. Agency for International Development (USAID) to analyse the relationship between policy impacts and a potential demographic dividend. DemDiv is an open-source tool with a transparent methodology. The model was designed for high-fertility countries to demonstrate how increasing investment in multi-sectoral policies in education, health and the economy can result in social and economic benefits.

The model has been used by policy makers in several African countries to explore the potential impacts of social and economic investments. Countries including Kenya, Malawi, Uganda and Zambia have used the model to analyse how the combined power of policy investments in health, education, family planning and the economy could generate a demographic dividend capable of playing a key role in accelerating socio-economic development to achieve national goals.

UNICEF conducted a meeting in mid-2017 with experts from the World Bank, USAID and various academics to discuss ways to populate and refine the DemDiv model to reveal potential impacts on children in Africa.

The DemDiv modelling tool consists of two parts. The first projects demographic changes and simulates the impact of key variables such as girls’ education and contraceptive prevalence on future population size and composition. The second part projects economic changes, with equations to estimate employment and investment, along with an estimate of GDP and GDP per capita. The Model uses indicators that reflect the general economic situation and the extent to which a country offers an enabling environment and infrastructure for promoting job creation, economic productivity and investments as well as education. These variables can be adjusted to simulate their impact on economic outcomes. A more detailed explanation of model equations and the data sources used in this report are described in the appendices (see Explanatory Notes for the DemDiv Model, page 63).

Three different scenarios for future development were compared to show the varying benefits of different combinations of investments on GDP per capita. The first scenario, ‘base trends’, assumes modest growth in education and economic indicators – a business-as-usual scenario. The second scenario, ‘education’, doubles the mean years of schooling and school life expectancy over the simulation period, with an increase of roughly 2 per cent per year. For the third scenario, ‘education and economic’, both education indicators and scores on economic indicators were doubled for the same period. These models place much of the weight of attaining the demographic dividend on economic factors. The scenarios used are considered realistic, given the starting point for many African countries, past trends in the region and the challenge of investing in the education system sufficiently to accomplish this change. Faster and more ambitious scenarios are also possible, but our aim was to be conservative, and examine the potential impact of these investments on the dividend. The next section presents the aggregate results of the simulation.

Under the base trend scenario, GDP per capita was projected to grow by an annual average of 1.9 per cent for the African continent. Under the education scenario, GDP growth rose at around 2.4 per cent annually. The third scenario resulted in annual average GDP growth per capita of 5.2 per cent for Africa as a whole, with values ranging between 4.5 and 5.8 per cent across the region, through 2050.

The analysis showed that even under these moderate scenarios, all of Africa’s sub-regions could expect up to a four-fold increase in GDP per capita income by 2050 (see charts in Figure 2.5 B). Even after adjusting for changes in purchasing power parity, this could go a long way towards reducing poverty and stimulating prosperity on the continent. Setting targets for the education and economic sectors in national policy planning and taking into account population change will be key to gaining an economic and social dividend.

### Scenarios of the DemDiv Model

**Base trends**

Modest growth in the education and economic indicators are continued – as a business-as-usual scenario.

**Education scenario**

The mean years of schooling and the school life expectancy over the next 40 years are doubled or increased at approximately 2 per cent per year.

**Education and economic scenario**

The education indicators and the scores on the economic indicators over the next 40 years are doubled.
By keeping children in education for twice as long and by fostering strong, open economies and institutions, Africa’s sub-regions and countries could experience demographic dividends that elevate per capita incomes by up to four-fold by 2050.

**FIG. 2.4** Average annual growth rate GDP per capita by region, 1971 to 2015

**FIG. 2.5 A** Average annual growth rate GDP per capita in Africa under different scenarios, 2015-2050

**FIG. 2.5 B** GDP per capita (PPP, constant 2011 international $) by African Union region in 2015 and under different scenarios in 2050

Policy Actions for Investing in Africa’s Children

Attaining Africa’s demographic dividend in the 21st century begins now with investing in children

This is a pivotal moment for Africa’s demographic transition. During the coming decades, Africa’s working age population will continue to increase as a share of the overall population – opening the window for a demographic dividend with the potential to lift hundreds of millions out of extreme poverty and place the continent on the pathway to prosperity. Unlike other regions, almost all African countries have the opportunity to reap a demographic dividend during the 21st century, provided that the appropriate policies are in place: policies capable of strengthening the human capital base and attracting investments for job creation in infrastructure and business.

As UNICEF underscored in 2014 in its first demographic report, Generation 2030 Africa, the opposite scenario is also possible – and sobering. If Africa fails to make the appropriate policy choices and social, economic and environmental investments, the continent risks a social and economic disaster. The combination of massive population growth and the risks emanating from climate change, rapid urbanization and lack of social safety nets could lead to rising unemployment, under-employment and deprivation, forcing millions more to migrate.

The time to act is now. The African Union named 2017 as the year of ‘Harnessing the Demographic Dividend through Investments in Youth’, because if the continent begins to build its human capital by stepping up investments in children and youth, by the time the window of opportunity opens for the majority of AU Member States, a firm foundation will be in place for a dividend in many countries and the continent as a whole. Momentum within Africa should be acknowledged and supported by the broader international community, as investment – or the lack thereof – will have global consequences as Africa’s share of the world population grows.

This third and final chapter of Generation 2030 Africa 2.0 sets out the broad social and economic policy agenda required across the continent to win demographic dividends. The recommended actions are ambitious, practical and achievable, and will contribute significantly to achievement of the 2030 Agenda for Development, the recently adopted Africa’s Agenda for Children 2040 and the African Union’s own Agenda 2063.

Discussions held with a broad array of African stakeholders, including policymakers, business leaders, civil society, academia and youth leaders, all influenced this report. Based on these discussions and an extensive literature review, UNICEF formulated several key policy actions.

Africa has a robust normative policy and results frameworks for investing in its children in the 21st century

The normative policy and results frameworks for investing in Africa’s children and youth has been well-established over the past 25 years or so. All African countries ratified the 1989 Convention on the Rights of the Child (CRC), the global human rights treaty defining the rights of all children and the responsibilities of States Parties to realize these rights. Unique among the world’s continents, Africa also chose to adopt its own bill of rights for children – the 1990 African Charter on the Rights and Welfare of the Child. This charter reinforces the provisions of the CRC, while also adding articles on such issues as protection from apartheid and discrimination, armed conflict and child refugees that are not specifically stated in the Convention.

To truly and fully realize the rights of every African child, these normative principles must be matched with ambitious goals and targets, sound implementation strategies and robust accountability mechanisms designed to achieve meaningful and lasting change. Following the 2000 Millennium Declaration and Millennium Development
Goals and the subsequent adoption of the 2030 Agenda for Development by the United Nations General Assembly in 2015, Africa has benefited from being party to a strong set of international goals and targets. It is already clear that most of the global goals embodied in the 2030 Agenda for Development cannot be met without more robust efforts to accelerate progress in Africa.

In addition, the African Union has also outlined its own agenda – Agenda 2063 – that is shaping the social, economic and environmental goals for the continent for the coming decades. Agenda 2030 and Agenda 2063 are closely aligned, with the latter focusing more on the key milestones that the continent has to achieve in the coming 46 years to realize its potential.

In recent months, a specific set of aspirations for children has emerged entitled Africa’s Agenda for Children 2040. This Agenda is based on 10 specific aspirations for children that are well aligned with both the global 2030 Agenda for Development and the Agenda 2063 for all citizens. Africa’s Agenda for Children 2040 is aligned with Aspiration 6 of the Agenda 2063: An Africa whose development is people-driven, relying on the potential of African people, especially its women and youth, and caring for children. The Agenda aims to put children at the centre of Africa’s economic and social renaissance.

Achieving the aspirations of Africa’s Agenda for Children 2040 can also be an important milestone along the way for the attainment of the broader AU Agenda 2063. If its aspirations are attained, and every African child is surviving, thriving, learning, protected, participating and free from threats of disasters, conflict and violence, then the continent will have set the basis for decades of prosperity and stability that will make the achievement of Agenda 2063 a distinct possibility. For example, if every child is in pre-school and access to primary and secondary education is universal and learning is of a high quality, Africa will have gone a long way towards having the human capital base to grow and compete economically in the 21st century, and reduce its dependence on financial inflows of development assistance.

Normative frameworks for investing in children must be complemented by practical action on the ground to achieve a demographic dividend

Normative frameworks, however, represent only one component of the drive toward a demographic dividend. Implementation of the policies and programmes required to meet goals and targets is critical to overall success. In this area, it is unclear whether Africa as a whole is on the pathway to success. Several countries are making great strides toward the goals embodied in these agendas. But almost universally, governments, academia and civil societies cite implementation bottlenecks such as capacity constraints, weak governance, low budget utilization and lack of transparency as important barriers to faster progress.

Strengthening implementation capacity is imperative to reaping demographic dividends at both the continental and national levels.

Many countries continue to experience sizeable gaps in the area of essential service provision, when compared to recommended minimum international standards by agencies such as the World Health Organization, as outlined in Chapter 2. Although many countries have the potential to bridge these gaps and meet these standards, commitment and investment have not been yet prioritized.

If all African countries were to meet international minimum standards for essential services such as healthcare and education by 2030, it would represent a significant stepping-stone towards achieving each of the three agendas (2030, 2040 and 2063) and a demographic dividend for the continent. It would also support health, education and other social systems to withstand risks and stressors such as natural disasters, disease outbreaks, commodity price volatility and climate change. But the rate of progress must be accelerated: unless such investments are rapidly scaled up in the coming decade, Africa will not have the human capital base to make its economies sufficiently competitive to reap a significant demographic dividend. Worse still, given the projected population expansion, low or moderate economic growth could lead to stagnating per capita income in many countries, resulting in increased numbers of Africans living in poverty.

Country examples described in Box 3.1 demonstrate that several Asian countries starting with similar conditions to those currently being experienced in Africa have made great progress towards a demographic dividend. For Africa to reap a demographic dividend when the opportunity arrives, investments in children must be made now.
AFRICA’S AGENDA FOR CHILDREN 2040

Africa’s Agenda for Children presents measurable goals and priority areas to which the African Union and its Member States commit themselves for the coming 25 years. The Agenda is articulated around 10 Aspirations:

Aspiration 1: The African Children’s Charter, as supervised by the African Children’s Committee, provides an effective continental framework for advancing children’s rights.

Aspiration 2: An effective child-friendly national legislative, policy and institutional framework is in place in all member States.

Aspiration 3: Every child’s birth and other vital statistics are registered.

Aspiration 4: Every child is born alive and survives infancy.

Aspiration 5: Every child grows up well-nourished and with access to the basic necessities of life.

Aspiration 6: Every child benefits fully from quality education.

Aspiration 7: Every child is protected against violence, exploitation, neglect and abuse.

Aspiration 8: Children benefit from a child-sensitive criminal justice system.

Aspiration 9: Every child is free from the impact of armed conflicts and other disasters or emergency situations.

Aspiration 10: African children’s views matter. Input on the draft Agenda and contribute to its adoption.
Tailored population policies and programmes
A key to successful population policy is to improve both the quantity and quality of health centres and family planning programmes. When implementing family planning programmes, outcomes can be maximized by considering the local context and culture and designing services accordingly. For example, in the Republic of Korea direct social assistance by field workers proved to be more effective than clinic-based services for reducing fertility rates. Likewise, assessing methods of delivery of culturally sensitive, voluntary reproductive services can contribute to national fertility transition.

Child survival
Historic patterns of demographic transition reveal that improvements in child survival typically precede sustained fertility decline. Better child health and survival rates reduce demand for more children, which in turn improves maternal health by maintaining smaller family sizes. This eventually creates a virtuous cycle in which child health improves as a result of strengthened parental care, and quality childcare becomes more affordable for households.

Education, especially girls
Investing in female education is among the most effective means to attain a demographic dividend, because of the observed relationship between higher levels of women’s education and lower fertility rates. While child marriage contributes to higher fertility, the provision of quality education results in lower fertility and increased productivity. In Africa, coupling education policies with culturally sensitive voluntary family planning programmes has the potential to accelerate progress toward the demographic dividend.

Skills training for the real world
As Africa is set to have a rapidly expanding adolescent and youth cohort, it is imperative to ensure that these future workers are well prepared and have skills that are readily transferable in the labour market. For example, the Republic of Korea’s shift toward a primary school curriculum fostering “production-oriented” education in the 1970s helped students to gain knowledge and skills relevant to the workplace, enabling the country to reap the demographic dividend through enhanced manufacturing.

Long-term economic plans
In addition to investing in the health and education of its current and future citizens, it is also important that countries establish good governance and long-term economic policies to have the opportunity to reap a demographic dividend. When creating decent jobs, promoting trade openness or providing access to credit, economic policymaking must consider key demographic factors and long-term gains.

Women’s empowerment
Women with fewer children are much more likely to enter the formal sector and earn higher incomes. The Republic of Korea specifically targeted women’s labour force participation as a key policy to boost growth, savings and consumption, encouraging young women workers to play a dominant role in the initial stage of the country’s economic growth. Empowering women and girls could have a similar economic impact in Africa.

Confluence of 3 Es (empowerment, economy and education)
Historically, countries that reaped a demographic dividend – especially in East Asia – experienced a favourable convergence between global economic trends and national population dynamics. While the degree of success varied by country, the most effective synergy of these key drivers was fuelled by efforts to empower children and youth, both socially and economically. Without empowering the younger generation through investing in their education skills and health, a dramatic economic transformation is probably unattainable – even with a favourable population structure. Africa has an opportunity to leverage the lessons learned from other regions, seeking to achieve confluence between the three streams critical to achieving a demographic dividend – economy, education and empowerment.
How other countries took advantage of the window of opportunity

When these countries opened the demographic window of opportunity, their initial conditions were similar to those currently experienced in much of Africa. As highlighted in Chapter 2, these scenarios are also possible for Africa if adequate investments are made.

**How?** Known to have achieved the ideal dividend of demographic transition, Republic of Korea focused on developing “production-oriented” curricula between 1960–1970 and placed strong national importance and emphasis on well-trained human capital.

**How?** Since late 1970s, a lower rate of natural growth in population and the need for low-skill labour resulted in a deliberate shift in policy to allow more migrants to live and work in the country, and net migration surpassed native population growth by 2000s.

**How?** Alongside the demographic dividend, Thailand is said to have achieved one of the most rapid family planning uptakes in Asia. Between 1970 and 1990, the Ministry of Health slowed population growth by expanding access to and use of voluntary family planning.

---

*The Size of Demographic Dividend is assessed based on literature review and UNICEF analysis for comparability and illustration purposes.

**Note:** The tables are meant to be illustrative only. The extent of a demographic dividend vary considerably depending on the context and time in which they occur, and the specific characteristics of the economy. These tables do not imply strength of association nor casualty.

Key policy actions for Generation 2030 Africa

Scale up Africa’s essential services and systems-strengthening in health, social welfare and protection to bring these up to international standards, and beyond these standards for those countries that are already close to attaining them.
POLICY ACTIONS

and skills of community health workers. Health administrations also face the challenge of better supporting both professional and community health workers through better working conditions and improved training, support, salaries and benefits.112

In addition to health system strengthening, considerable progress is also possible through scaling up integrated packages of health and health-related interventions. Many African countries still reach too few children with essential, cost-effective interventions such as lifesaving vaccines, basic medicines, nutritional supplements, access to clean water and basic sanitation, anti-retroviral drugs, improved hygiene and nutrition and increased care seeking.113 Despite decades of efforts to advance multi-sectoral health care programmes, too often such interventions are being delivered in vertical silos, missing out on the benefits and economies of scale that integration can bring.114

Expanding health care services in Africa will require the scaling up of financing modalities on both the supply and demand sides. On the supply side, increased funding is needed to train and support larger numbers of both professional and community health workers and to augment facilities. On the demand side, the cost of health care is still prohibitive for the poorest African families, for whom even simple procedures have major financial implications.

Stepping up social protection for these families could clear this bottleneck. Social protection has proven to be a game-changer in many African contexts by enabling families to move out of poverty, send children to school, seek health services and adequately plan for and protect themselves against shocks and crises. Moreover, as stressed in Article 26 of the Convention on the Rights of the Child (CRC), it is the fundamental right of every child to benefit from social security, including social insurance. Yet coverage, quality and financing remain limited, leaving many African families and communities without access to this protection. Supporting governments to introduce and deliver on social protection floors could go a long way toward reducing poverty and inequality and improving the social outcomes required to support a demographic dividend. It will also be important to systematically link social protection to key contributors to child development (such as education, health and nutrition), while also fully recognizing the rights of all children, especially the most vulnerable.

Finally, a healthy workforce is a prerequisite for achieving the demographic dividend. With Africa’s labour force set to double over the next 35 years, it is imperative that the continent invest more in health care, particularly during the earliest years of life, to create a solid foundation for a productive and healthy workforce later in the century.

2. Skills enhancement

Great strides have been made in improving education for Africa’s children over the past two decades. Gross enrolment rates for pre-primary education have more than doubled, and primary-level net enrolment increased from 64 per cent to 80 per cent between 2000 and 2015. Primary completion rates have climbed to 74 per cent and gender parity for completion has improved to 0.94. Although increases in secondary enrolment have occurred at an even faster rate than those for primary school, it remains well below the global average.

These advances reflect a confluence of factors. In countries like Ghana, for example, making primary education compulsory compelled parents and guardians to send their children to school. Abolishing school fees reduced the financial barriers to education. Investment in school building and teacher training helped to support increased enrolment, and communities are increasingly engaged in school management.

Despite these gains, providing quality education for all of Africa’s children remains an important challenge. Evidence shows that relative to other continents, Africa still has high rates and numbers of out-of-school children, high rates of primary school dropout and weak transition from primary to secondary education, as well as low secondary completion rates. In addition, many children start school at an older age, putting them at a disadvantage and increasing their risk of dropout.

In addition, there is a severe shortage of accessible pre-primary facilities that can foster primary school readiness. Despite large gains in many countries, enrolment rates in pre-primary education remain in single digits in several African countries. Additionally, formal pre-primary education is often an option limited to privileged children from the wealthiest households and those living in affluent urban areas. For the others, lack of pre-primary opportunities can contribute to poor performance during the early years of primary education and can cause children to drop out at an early age.

Other constraints include structural issues, such as the lack of effective, transparent and accountable public budget management on education; high out-of-pocket costs for poor families in countries where basic education is not compulsory; high opportunity costs of schooling for families; and the quality of schooling (overcrowded classrooms, inadequately trained and poorly motivated teachers, safety in and around schools). In several African countries, more than half of all youth are illiterate – despite having attended primary school – and many adolescent girls face child marriage and teenage pregnancy, which often leads them to discontinue their education.

The demographic dividend model presented in Chapter 2 illustrates the potential impact on Africa’s prosperity of raising educational investment. Doubling the aggregate years of schooling over the next 35 years could have a tremendous impact on lifting per capita incomes and pulling hundreds of millions of Africans out of poverty.

Transform Africa’s educational, skills and vocational learning system through systems-strengthening, curricula reform and access to technology, to enhance learning outcomes and match the skills of Africa’s children and youth to current and future labour market needs.

Given the scale of the challenges faced in education, an extensive transformation is urgently required. This must begin in the earliest years through investment in early childhood development and early childhood education. It must continue into primary school, with particular emphasis on getting all African boys and girls enrolled in and attending school at the appropriate age and ensuring that they complete primary education and make the transition to secondary school. Inclusive, equitable and quality education can change lives – it can support girls and boys, men and women to question, challenge and change negative gender norms and contribute to the creation of strong and equitable relationships, systems and institutions.

Education policies must also be designed to meet the needs of adolescents, preparing them to participate and compete in Africa’s expanding and competitive labour market. Within this sphere, girls’ education is particularly important, as in addition to fulfilling their right to learn, it is associated with delayed marriage and childbearing, increased birth spacing and enhanced nutrition and hygiene, all of which contribute to lower child and maternal mortality and a better start in life for children.

Further, for all boys and girls, taking into account the educational and technological transition from the earliest stage of schooling will be all the more urgent. Through an adequate curricula reform, African schools can meet the needs of technological development, building a stronger and more resilient human capital and embuing children and youth with relevant skills for future needs.
The Human Capital Index calculated by the World Economic Forum (WEF) finds that sub-Saharan Africa currently utilizes only just over half of its human capital potential, despite being the world’s youngest region and facing phenomenal growth of its working age population which is set to rise from 370 million in 2010 to over 600 million in 2030. Inadequate training of young workers and employers across the region represents a major constraint to business.

A recent WEF report on the future of jobs and skills in Africa also revealed that only five countries among the 25 African countries assessed exceed the global average for education system quality. This result suggests that learners are not acquiring the knowledge and skills required for today’s economies and societies and those of the future. The WEF report estimates that 15–20 million young people are expected to join the African workforce every year for the next three decades. This implies that the continent urgently needs to build a human capital base that can cope with the major disruptions to labour markets resulting from increasing automation, growth in unconventional occupations, new skills requirements for all jobs and new tools to augment workers’ capabilities.

To prepare today’s and tomorrow’s workforce to fully unleash its potential against the changing trajectory of jobs, the report suggests a number of future-ready strategies. Among them, four particular areas provide key action points for all African countries:

→ **Provide robust and respected technical and vocational education and training**
  Along with increasing the workplace relevance of formal secondary, and even post-secondary, education for adolescents and children across the region, increased support should also be given to Africa’s widespread practice of offering informal apprenticeships, to ensure quality and relevance.

→ **Create a culture of lifelong learning**
  This is particularly crucial given the pace of technological developments and Africa’s generally uneven provision of formal education. Skills acquisition across all types of training will be increasingly essential, and the focus should be providing the youth and children a way to recognize opportunities and hone their capacities accordingly.

→ **Ensure the future-readiness of curricula**
  In addition to offering quality education in science, technology, engineering and mathematics (STEM) from the early stages of school life, encouraging critical thinking, creativity, cognitive flexibility and emotional intelligence should be prioritized in Africa. Special attention should also be given to encouraging more girls to work in STEM.

→ **Invest in digital fluency and ICT literacy skills**
  As in many high-income countries, digital fluency and information, communications technology literacy skills will be the new default skillset required by Africa’s future labour market. Possessing these skills can also contribute to ending the vicious cycle of poverty by equipping people with adequate tools to enter a larger labour market and design home-grown and entrepreneurial solutions that do not require high levels of capital investment.

Adapting learning in Africa to future job requirements must start now – beginning by investing in the education of children and youth.
**PROTECTION AND EMPOWERMENT**

Africa has made considerable progress toward protecting its children from violence and abuse in recent decades. As stated earlier in this report, the incidence of women aged 20–24 years marrying before age 18 – the standard measure for child marriage – fell from 44 per cent in 1990 to 35 per cent in 2015, the latest year for which continental aggregates are available. Moreover, in all of Africa’s five sub-regions, child marriage rates have decreased over the past 20 years, as has the incidence of harmful traditional practices such as female genital mutilation/cutting (FGM/C). Notwithstanding this considerable progress, Africa still presents among the world’s foremost protection challenges for children and women. Almost one in every three women marry before reaching the age of 18. One of every six girls under 14 years of age in 18 African countries (with comparable data) is still subjected to FGM/C. Moreover, permissive attitudes towards violence against women are still pervasive on the continent.

These protection abuses not only violate the human rights of women and girls, but they also constrain social and economic progress in Africa and have the potential to undermine progress toward the demographic dividend. Like the impact of poor nutrition or inadequate sanitation, protection violations undermine the productivity of women in the labour force. Empowering women has been a driving force behind demographic dividends in other parts of the world, along with a reduction in key protection violations such as child marriage and harmful traditional practices.

There are many proven and promising solutions to reducing protection abuses against children and women in Africa. Countries such as Burkina Faso and Ethiopia have demonstrated that sound solutions, backed by judicious investments and political commitment, can generate rapid progress toward bolstering protection. What is most needed now is concrete investment and support to transform continent-wide commitments to protection into reality.

Important steps have been taken towards empowering Africa’s women and girls in recent decades. In addition to the decline in protection abuses and improvements in reducing gender inequality in education, women’s participation in the labour force has also continued to rise: from 51 per cent in 1990 to 55 per cent in 2016, according to the latest estimates from the International Labour Organization. Women’s participation in political life has also increased; women now hold 23 per cent of Africa’s parliamentary seats, up from 10 per cent in 2000. Yet these successes cannot mask the enormity of remaining challenges in gender equality and female empowerment in Africa. The percentages of African women in both the formal workforce and political life remain low by international standards. Gender parity in primary education is not matched in secondary schools, where there is still a marked gap between girls and boys for enrolment and attendance, despite recent progress. The work that African women and girls contribute to their households and communities – such as fuel and water collection, child care and household chores – is not adequately captured in national and international measures of output and productivity, nor rewarded financially, and continues to place girls at a marked disadvantage.

A key aspect of women’s empowerment is fostering their access to culturally sensitive reproductive health services. This is imperative for managing Africa’s demographic transition. Demographic trends are not inevitable; most evolve in response to policies. As countries like Ethiopia, Ghana, Malawi and Rwanda...
and can attest, expanding access to reproductive health services is feasible and have a strong role in managing demographic transitions.\textsuperscript{138}

A continental discourse needs to emerge on how to expand access to culturally sensitive reproductive health education and services to reach Africa’s poorest and most marginalized communities – where fertility rates are highest, particularly among adolescent females – and reduce the unmet need for family planning.

Evidence shows strong linkages between population growth, poverty and inequity, and women’s empowerment.\textsuperscript{140} A significant proportion of Africa’s young women are disempowered – through lack of access to secondary education, premature entry into adult roles of marriage and parenthood, working outside the formal labour force and having little voice in community and political life.\textsuperscript{141} Reversing this situation presents a major challenge. Yet as several countries in Asia can attest, doing so can be a game-changer.\textsuperscript{142} With more, healthier and better-educated women working in the formal labour sector, contributing to taxation and consumption and to decision-making processes at the local, national and regional levels, countries’ potential to reap their demographic dividend will soar.\textsuperscript{143} But it is difficult to see how the continent can reap the dividend if half of its citizens continue to have low purchasing, political and social power.

Birth registration has long been seen as both a fundamental right of every child and a critical mechanism for holding governments accountable for realizing child rights. Sub-Saharan Africa has among the lowest birth registration rates in the world. Just 46 per cent of its children under five were registered between 2010 and 2015, and 16 of the continent’s countries with available data have birth registration rates below 50 per cent.\textsuperscript{144} Among the poorest households, more than 70 per cent of children are not registered.

The bottlenecks in this area are in part attributable to lack of coordination and integration between maternal, newborn and child interventions within countries. For example, 74 per cent of all African infants receive a dose of vaccine to prevent diphtheria, pertussis and tetanus (DPT3) on three separate occasions within the first year of life.\textsuperscript{145} Yet the continental birth registration rate is far lower than this figure – suggesting that the systems for administering these two vital early childhood interventions are not well-coordinated or integrated.\textsuperscript{146}

Given the availability of manual and digital systems and the multiple known benefits of birth registration – for children, communities and the larger society – there is considerable potential for improvement. African governments need to step up to the challenge of registering children, at birth or later, in order to be fully accountable for protecting their rights and to propel the continent to near-universal birth registration by 2030.

Africa has demonstrated immense ability to adapt to new technologies and processes, notably in information and communication technology. Mobile phone operators, for example, have a vast amount of administrative information on Africa’s youth that could be used to improve diagnostic capacity for understanding the state and conditions of their lives, and to plan better policies, interventions and systems for them.\textsuperscript{147}

Harnessing the technology and connectivity also provides the potential to increase the rates of birth registration. Registering all of Africa’s children and youth in the next 10–15 years will be a critical step towards enhancing the national, sub-regional and continental development planning essential for establishing the foundation for a 21st century demographic dividend for Africa.
Upscaling investments in children and youth

Maximize the use of available resources to increase investments in Africa's children and youth, targeting the most effective programmes and those with the greatest needs

The Convention on the Rights of the Child calls on governments to maximize the use of available resources to realize children's rights. Since Africa's demographic transition will increase its child population by about 170 million by 2030, investment in children is essential to the continent's future prosperity, security and stability. Maximizing budgetary resources and mobilizing new sources of development financing are critical steps toward helping Africa to bolster its human capital by investing in children and youth.

Africa is currently witnessing a rapid change in its development financing landscape. Like many things in transition on the continent, the old assumption that it is aid-dependent are fast disappearing. As UNICEF's recent report on Financing Development for Children in Africa attests, domestic resources mobilized through taxation policies account for the majority of funding of national budgets for most countries on the continent. While international cooperation will remain important, particularly for the poorest countries and those in fragile contexts, financing the investment in children and youth required to harness Africa's demographic dividend will primarily rely on domestic financing, channelled through national budgets. As the largest source of finance available to any country, government budgets hold the greatest potential for investing in children.

Options such as official development assistance and deficit management via international borrowing will remain critical – at least for the next few decades – as Africa finalizes the groundwork required to enable the next generation to take advantage of the window of opportunity. Support from the international community can explore new modalities of financing for development, with the understanding that Africa is now at the stage of building its capacity to undertake stronger domestic financing.

To make the best use of domestic resources, efficient and transparent management of government budgets will be imperative. Improving accountability will also help to enhance programme implementation, which often suffers from considerable capacity gaps. Transparency is a core component of accountable budgeting, as are public participation and formal oversight.

Over the coming decade enhancing budget transparency will be critical for African nations. Key steps recommended include: (i) implementing General Comment no. 19 of the CRC, which provides an overall framework for governments to invest in children; (ii) strengthening public financial management systems for children, including the use of programme budgeting to enable the tracking of spending and results and disaggregation of budget data; (iii) publishing more budget-specific information, including on budgeting for children; (iv) institutionalizing transparency within laws, rules and procedures; (v) institutionalizing participation, including by child rights advocates and young people; and (vi) institutionalizing and empowering oversight institutions.

Domestic resource mobilization and reforms to the tax system will also be critical to increasing investments in children. Especially in Africa, where the share of informal sector is significant in many countries, targeting sectors that are currently untaxed holds
great potential to increase revenue, as does strengthening overall revenue collection capacity and reducing evasion. However, it is important that reform measures are progressive, so that the most vulnerable families are not further burdened by higher tax obligations.

Political will dictates where resources are directed. For example, in all sub-Saharan African countries, salaries currently account for the largest share of current expenditure in primary education. The situation is similar in the health sector. According to a recent case study on sub-Saharan Africa’s access to health care, salary and personnel expenditures absorb between 60 and 70 per cent of hospital resources. If Africa is to train millions more teachers, doctors, nurses and midwives, maximizing resources for these investments will be imperative.

This will also require governments to explore new financing sources, such as levies on commodity exports, financial transaction taxes, local taxes and fees (such as on property taxes and parking fees) and debt instruments, such as municipal and social impact bonds. At the same time, decision makers will need to closely review current spending priorities and create fiscal space for investments that will catalyse the demographic dividend.

## CONCLUSION

Africa’s challenges and opportunities are increasingly important to the world. Now is the time to step up the efforts to attain the much vaunted demographic dividend. Ten, fifteen years down the road will be too late. The demographic window of opportunity will soon be opening for a greater number of African countries, and the continent can vastly expand the likelihood of achieving a demographic dividend by building a strong human capital base in the next decade and a half.

The cost of inaction will be higher than ever experienced, given the unprecedented magnitude of Africa’s demographic transition. Unless countries make the required investments to bring about the dividends, the projected demographic transition could easily turn into a burden. To avoid facing the demographic disaster, rather than the dividend, an extraordinary commitment of political will, sound strategies, enhanced implementation capacity and adequate financing are crucial, beginning now.

It will be challenging, like all things worthwhile. But it is a challenge that can and must be met to secure Africa’s future, and make the continent safe, secure, prosperous and equitable for its most precious asset: its children and youth.

---

### BOX 3.3

**SHARED RESPONSIBILITY: WORKING TOGETHER FOR A MORE EQUITABLE AND PROSPEROUS AFRICA FOR CHILDREN NOW AND IN THE FUTURE**

Capturing the demographic window of opportunity will require collective action at global, national, sub-national and local levels. While many of the policy actions are geared towards government and inter-governmental policies to build the foundations, other stakeholders also play a key role in realizing Africa’s demographic dividend. Among the many core stakeholders who can contribute are:

**The private sector** has an increasingly crucial role in building resilient human capital in Africa. Business people understand the skills and knowledge requirements for the ever-evolving market, and will be the ones employing millions of job market entrants in Africa every year. Together with other stakeholders, the private sector can help identify the required skills of today and tomorrow and help to provide children and youth with quality learning and training opportunities.

The role of **civil society and NGOs** is crucial to the attainment of a demographic dividend. In particular, civil society and NGOs will continue to play an essential role by supporting service delivery and fostering the empowerment of women, children and youth.

**Finally, Africa’s children and youth** are the key stakeholders in building a future fit for their needs and wants. Children have unique perspectives on many of today’s prominent issues and a great stake in the future impacts of the demographic transition. As Africa accelerates toward closing existing gaps and opening a new chapter of growth and prosperity, bringing these children and youth into the conversation and increasing their role in decision making is vital.
Immunization is free in Côte d’Ivoire for children below one year old. Yet, three children out of five do not get vaccinated before their first birthday.

**EXPLANATORY NOTES FOR THE DEMDIV MODEL**

**Data sources**
- The simulations were conducted with country data from several sources, including: the United Nations Population Division World Population Prospects, UNICEF statistical databases, UNESCO Institute of Statistics databases, World Bank World Development Indicators, ILO labour force statistics, World Economic Forum’s Global Competitiveness Index (GCI), and Penn World Tables 9.0, as well as nationally representative household surveys such as demographic and health surveys (DHS) and multiple indicator cluster surveys (MICs).
- When possible this analysis relied on country data, but in some cases missing values had to be estimated. Severe data gaps exist in several African countries, which either lack data on certain indicators or have only outdated data. Generally, this analysis was conducted using modelled estimates for several indicators, which may differ from national data.

**Construction of scenarios**
- Scenarios were analysed for the period 2015–2050 to determine the impact of improved education and economic indicators. Three scenarios were used: a basic trend scenario, and second scenario that first doubled education investments and a third that added economic indicators to the second scenario. Indicator values were doubled, whereby the highest possible values were capped so as to avoid the excessive input values. (e.g., the expected years of schooling was limited up to 20 years and the economic GCI indicators were capped with a score of seven).

**Aggregation**
- The simulation was undertaken for each of the African countries for the period 2015–2055, and aggregated to the regional level.
- Past trends were used to inform the base scenario. For example, over the past 50 years the average years of schooling in sub-Saharan Africa more than doubled (from 1960 to 2010, rising from 1.54 years to 5.23 years. For women aged 15 and above the average years of schooling increased from 1.12 years in 1960 to 4.65 years in 2010, while for males the increase was from 1.97 years to 5.82 years. Since 2006 sub-Saharan Africa as a whole has seen rising scores for public institutional quality, labour market flexibility, financial market efficiency and infrastructure related to information and communication technology. Average scores rose by about 1.5 times. Since 2006, all countries in the pre-dividend stage have increased the proportion of imports as a percentage of GDP, exceeding the percentages of countries in the early dividend stages.

**Country applications**
- Of note, the DemDiv model provides projections for an illustrative purpose and the actual application may considerably vary by countries. For example, in several African countries recent growth rates were higher than the overall regional or sub-regional growth rates predicted by the model. In particular, the annual average growth in Ethiopia, based on World Bank estimates from 2010 onwards, varied between 5 and 10 per cent.
- This analysis in the report shows only sub-regional and regional results. Engagement with country stakeholders is recommended to reach a mutual understanding of how the model projects a country’s future economic and population growth. This exercise requires involvement by multiple stakeholders to ensure that goals and targets are set to meet a country’s needs and take into account its specific context. For example, as underscored in Chapter 2, countries such as Kenya, Malawi, Uganda and Zambia engaged at the ministerial level, with technical support from research institutes (Futures Group and African Institute for Development Policy), to better assess the economic benefits of the potential demographic dividend and provide an evidence-based outlook to policymakers.

This report follows up the first *Generation 2030 Africa* report, published in August 2014, which outlined pivotal changes in Africa’s child demographics. The new report uses latest population projections showing that by 2050, the continent will account for 42 per cent of all global births and almost 40 per cent of all children under 18. The report presents modelling indicating that if African nations invest in their growing population of children and young people, in particular in their education, and adopt economic policies that foster new jobs, the continent as a whole could see per capita incomes increase up to four-fold. The first, crucial step to achieving this demographic dividend will be to close the gaps that exist within Africa’s health and education systems.
