KEY FACTS about child marriage in Bangladesh

Bangladesh is home to 38 million child brides, including currently married girls along with women who were first married in childhood. Of these, 13 million married before age 15.

Bangladesh ranks among the top 10 countries in the world with the highest levels of child marriage.

A girl’s risk of child marriage is influenced by certain background characteristics. Child brides are somewhat more likely to reside in rural areas and to live in poorer households, and are less likely to have more than a secondary education.

Nearly 5 in 10 child brides gave birth before age 18, and 8 in 10 gave birth before age 20.

Married girls are over four times more likely to be out of school than unmarried girls.

Meeting the SDG target to end child marriage by 2030, or the national target to end child marriage by 2041, will require a major push. Progress must be at least 8 times faster than the rate observed over the past decade to meet the national target, or 17 times faster to meet the SDG target.

The practice of child marriage is less common today than in previous generations.

Declines in the practice have been observed across wealth groups, with more progress seen among the richest.

Fifty-one per cent of young women in Bangladesh were married before their 18th birthday.

Bangladesh ranks among the top 10 countries in the world with the highest levels of child marriage.
CURRENT LEVELS OF CHILD MARRIAGE

In Bangladesh, 51 per cent of young women were married in childhood

Among the country’s entire population of girls and women, 38 million married before the age of 18; of those, 13 million married before age 15

Target 5.3: Achieve gender equality and empower all women and girls

Indicator 5.3.1: Proportion of women aged 20 to 24 years who were first married or in a union before age 15 and before age 18

SDG 5: Achieve gender equality and empower all women and girls

Child marriage in the global development agenda

Child marriage is a violation of human rights. Every child has the right to be protected from this harmful practice, which has devastating consequences for individuals and for society. Child marriage is now firmly on the global development agenda, most prominently through its inclusion in Sustainable Development Goal (SDG) target 5.3, which aims to eliminate the practice by 2030. Although indicator 5.3.1 measures child marriage among girls, the practice occurs among boys as well. Regardless of gender, marriage before adulthood is a breach of children’s rights. In addition, child marriage has an impact on the realization of other SDGs related to education, health and well-being. For girls, the specific power dimensions and negative gender norms must be considered in the progressive realization of human rights.

Target 5.3:Eliminate all harmful practices, such as child, early and forced marriage and female genital mutilation

Indicator 5.3.1:Proportion of women aged 20 to 24 years who were first married or in a union before age 15 and before age 18

Note: Figures do not add up to total due to rounding.
Bangladesh has the highest prevalence of child marriage in South Asia, and is among the 10 countries worldwide with the highest levels.

Notes: For the purpose of this analysis, high-prevalence districts were defined as those with a prevalence of child marriage of 70 per cent or higher. High-burden districts, or those with the largest number of girls and women of all ages who were married in childhood, were defined as those home to at least 1 million child brides. Bogura is both a high-burden district and a programme district.

Notes: The standard measure of child marriage refers to both formal marriage and informal unions. Data for Bangladesh refer to marriage only, as information on informal unions was not collected, but data for other countries shown in this figure use the standard definition, which refers to both types of unions.

In many districts across Bangladesh, the majority of young women were married in childhood.

FIG. 3 Percentage of women aged 20 to 24 years who were first married or in union before age 18

South Asia

Bangladesh has the highest prevalence of child marriage in South Asia, and is among the 10 countries worldwide with the highest levels.

Notes: For the purpose of this analysis, high-prevalence districts were defined as those with a prevalence of child marriage of 70 per cent or higher. Ending Child Marriage: A profile of progress in Bangladesh

Child marriage begins to decline only among those with at least 10 years of schooling, and prevalence falls below 50 per cent among those with at least 12 years of schooling.

FIG. 6: Percentage of women aged 20 to 24 years who were first married before ages 15 and 18.

Notes: Values in parentheses are based on 25 to 49 unweighted cases. Values based on fewer than 25 unweighted cases are suppressed.

Child brides are somewhat more likely to reside in rural areas and to live in poorer households, and are less likely to have more than a secondary education.

FIG. 5: Percentage of women aged 20 to 24 years who were first married before ages 15 and 18.

Notes: Ethnicity was determined by asking respondents about their ethnic identity. The “Other” category includes Chakma, Sotái, Marna, Tripura, Garo, Tanchangya, Mro, Khasia and Manipuri, as well as any other ethnic groups aside from Bengali. Data for these ethnic groups are collapsed for reporting as they comprised only 1.2% of the survey population in total.

Notes: Values in parentheses are based on 25 to 49 unweighted cases. Values based on fewer than 25 unweighted cases are suppressed.
Those with an education beyond secondary school are least likely to be child brides, even if they live in poorer households and reside in rural areas.

Among districts most affected by child marriage, differences in prevalence are most evident by education levels, rather than wealth or place of residence.

Notes: Values in parentheses are based on 25 to 48 unweighted cases. Values based on fewer than 25 unweighted cases are suppressed.

Notes: See page 6 for information on the selection of districts shown here. In each of the three charts, only districts with 25 or more unweighted cases in both categories are presented.
Nearly one in three child brides have a spouse who is at least 10 years older compared to one in four young women who married in adulthood.

Nearly 5 in 10 child brides gave birth before age 18, and 8 in 10 gave birth before age 20. Early childbearing is much less common among those who married later.

**FIG. 9** Percentage distribution of currently married women aged 20 to 24 years by spousal age gap between the women and their partners

**FIG. 10** Percentage of ever-married women aged 20 to 24 years who gave birth before ages 18 and 20

**LIVES OF CHILD BRIDES**

### Spousal age gap

Note: Some figures do not add up to 100 per cent due to rounding.
Many districts show large disparities in early childbearing between child brides and women who married in adulthood.

FIG. 11 Percentage of ever-married women aged 20 to 24 years who gave birth before age 20, selected districts.

Even among child brides it is rare for young mothers to have several children, although child brides do go on to have somewhat larger families than women who marry in adulthood.

FIG. 12 Percentage of ever-married women aged 20 to 24 years who have had three or more live births.

FIG. 13 Mean number of children of ever-married women aged 45 to 49 years.

Notes: See page 6 for information on the selection of districts shown here. Only districts with 25 or more unweighted cases in both categories (married before age 18 and married at or after age 18) are presented. Values in parentheses are based on 25 to 49 unweighted cases.
Many women lack antenatal and delivery care in Bangladesh. In some divisions, child brides are even less likely to receive such services than other women.

FIG. 14a Percentage of ever-married women aged 20 to 24 years who had four or more antenatal care visits during their last pregnancy and who had a skilled attendant at their last live birth.

FIG. 14b Percentage of ever-married women aged 20 to 24 years who had family planning needs that are unmet by modern methods; levels are similar among child brides and those who married in adulthood.
Married girls are over four times more likely to be out of school than unmarried girls.

FIG. 15 Percentage distribution of adolescent girls aged 15 to 17 years by schooling status.

Currently married
- In school, at grade level: 80%
- In school, above grade level: 54%

Notes: The first table includes all countries in South Asia with nationally representative data on child marriage, and the second table includes the 10 countries with the highest prevalence of child marriage in the world. Countries are ranked from highest to lowest according to the 10-year rate of reduction. A negative rate indicates an increase in the prevalence of child marriage over the specified period. Caution is warranted in interpreting these rates, as in some cases the differences in prevalence in the last 10 years may not be significant.
ENDING CHILD MARRIAGE: WHAT IT WILL TAKE

If the rate of decline observed over the past 10 years doubled, the prevalence of child marriage in Bangladesh would drop to around 30 per cent by 2030 and to less than 15 per cent by 2050

FIG. 23 Percentage of women aged 20 to 24 years who were first married before age 18, observed and projected

Notes: The observed average annual rates of reduction quantify the rate of progress in the prevalence of child marriage over each period. A higher rate indicates faster progress. Required rates are calculated to illustrate what rate would be necessary in order to eliminate the practice by 2030, target 5.3 of the SDGs, and by 2041, the target set by the Government of Bangladesh.

Notes: The projection scenarios build on existing trends. They show expected values if progress over the past 25 years were to continue (in red), or if progress over the past 10 years were to continue (in yellow). A third scenario (in green) illustrates what could happen if the rate observed over the past 10 years were to double. The projections do not take into account the potential impact of events such as the COVID-19 pandemic, whose broad and likely long-lasting effects on the population are not yet fully understood. Nonetheless, it is worth noting that, because of economic uncertainty, interruptions in schooling, disruptions of services and other factors, the pandemic has the potential to threaten progress made thus far against child marriage.

If the rate of decline observed over the past 10 years doubled, the prevalence of child marriage in Bangladesh would drop to around 30 per cent by 2030 and to less than 15 per cent by 2050.

Meeting the SDG target to end child marriage by 2030, or the national target to end child marriage by 2041, will require a major push in Bangladesh.

Progress must be at least 8 times faster than the rate observed over the past decade to meet the national and divisional targets for ending child marriage by 2030 and 7 times faster in order to eliminate child marriage by 2041.

How to read this table

In Dakha, for example, progress needs to be 8 times faster than the rate observed over the last 10 years in order to eliminate child marriage by 2030, and 7 times faster in order to eliminate child marriage by 2041.

Technical notes

The purpose of this publication is to offer a descriptive analysis of the practice of child marriage in Bangladesh, covering the proportion and number of girls and women affected, disparities across different populations: a selection of key outcome measures for women who married in childhood; an evaluation of historical trends in prevalence; and projections for the coming decades. It relies on nationally representative survey data, namely from the Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS), which provide comparable data on the practice over time, along with data on respondents’ background characteristics and the impact of programmes and drivers of change that facilitate this analysis. Additional research questions, including on families’ decision-making about marriage, the impact of programmes and drivers of change fall outside the scope of this analysis.

To assess the prevalence of child marriage, this analysis used the proportion of women aged 15 to 24 years who were married before age 18. This differs slightly from the standard definition used in SDG indicator 5.3.1, which includes formal marriage and informal unions, since data on informal unions were not collected in Bangladesh. Levels of child marriage can also be measured among women aged 16 to 19 years, in Bangladesh, prevalence of marriage among this age group is 64 per cent. The number of child brides is defined as the number of girls under 15 who have already married plus the number of adult women who were married before age 18. This is calculated using the estimated prevalence of child marriage among each age cohort, applied to the female population in the respective cohort. This method relies on both household survey data for prevalence and demographic data for the size of the population. (See section below on ‘Data sources’).

The percentage of currently married adolescent girls aged 15 to 17 years should not be interpreted as an indicator of the risk of being married in childhood. Any prevalence measure among girls under age 18 will be an underestimate of the full extent of the practice, since girls who are unmarried at the time of data collection may still marry before their 18th birthday.

Global estimates are based on a subset of 91 countries with comparable data from 2002-2013, covering 77 per cent of the global female population. Regional estimates represent data covering at least 50 per cent of the regional population.

Confidence intervals are shown for a subset of charts in this publication, including those that present results disaggregated by various groups or countries, that difference has been confirmed as statistically significant.

Trends at the divisional level in Figure 20 were calculated using a tailored approach for each division due to changes in administrative boundaries over the period of analysis. For each division, all available surveys conducted after the division was established were used for the trend analysis. In Barisal and Khulna, all 10 surveys were used since no boundaries have changed. For trends in Sylhet and Chattogram (formerly Chittagong), all available surveys except the DHS 1993-1994 were used since Sylhet was separated from Chattogram in 1986. For trends in Rangpur and Rajshahi, DHS 2011 and 2014 and MICS 2012-2013 and 2019 were used since Rangpur was separated from Rajshahi in 2010. Since Mymensingh was separated from Dakha in 1975 and thus these divisions with their present borders were not represented in earlier surveys, the trend lines for these two divisions are constructed using district level data for the districts that make up each division. For trends at the district level in Figure 20, all available surveys that are representative at the district level were used (MICS 2006, 2012-2013 and 2019).

‘Childhood’ refers to the period from birth until the 18th birthday. ‘Adulthood’ refers to the period starting at age 18.

Data sources

Ending child marriage is a priority for both the Government of Bangladesh and its development partners, who recognize the need to preserve childhoods, secure children’s rights to life and education, reduce their exposure to violence and exploitation, and contribute to ending intergenerational poverty. The country’s Child Marriage Restraint Act (2017) as well as the National Plan of Action to End Child Marriage (2018-2019) lay out the steps the Government is taking to reach these goals. Political engagement at the highest levels has paved the way for all development partners to explore more targeted solutions to this important issue.

Bangladesh is among the selected countries covered under the UNFPA UNICEF Global Programme to Accelerate Action to End Child Marriage. The goal of the programme is to shift existing social norms and raise awareness around gender inequality so that girls are free from the risk of child marriage and have a wider range of life options. The programme contributes to the National Plan of Action to End Child Marriage and is aligned with its five pillars: sector-based policies; legal reform, policies and accountability; programmes, life values and norms; empowerment of adolescent girls; and social protection systems for adolescent girls.

As the programme transitions into phase II, it will expand and improve its activities to target the most marginalized and hard-to-reach girls. It will focus on strengthening existing systems and increasing government ownership in order to translate policies and laws at the subnational level, provide better monitoring and evaluation framework is being developed, along with a budget, for the implementation and monitoring of the programme.

Investing in and supporting adolescent girls through community engagement and positive behavior: Families, communities and local and religious leaders are being mobilized through community dialogues to act as allies to end child marriage. Positive gender norms and key behavioral issues are also being addressed through communication at the household level, social mobilization among local-level community groups, and conversations with parents, among others. This will also include messages about the negative consequences of child marriage and actions to stop the practice being disseminated through multimedia and social media, reaching more than 150 million people.

Increasing resources and opportunities for adolescent girls.

A key thrust of the programme is building the capacity of systems to deliver integrated, coordinated and quality programmes and services for adolescent girls. The main focus is on education, health and social protection. The efforts seek to improve access and develop gender-equitable learning and skills. Many of these interventions target barriers faced by adolescent girls (married, divorced and widowed) in urban settings. A scoping study will produce a baseline assessment of the models that have worked and how they can be scaled up.

Many of these interventions target barriers faced by adolescent girls (married, divorced and widowed) in urban settings. A scoping study will produce a baseline assessment of the models that have worked and how they can be scaled up. The most marginalized out-of-school adolescents receive informal on-the-job apprenticeship training in which technical and life skills training have been added. Improving health and well-being through gender- and age-responsive adolescent health and reproductive health services is another key intervention, focusing on gender-based violence, sexual and reproductive health and rights, nutrition and mental health.

Strengthening legislative and policy frameworks to protect and promote the rights of adolescent girls.

A strong strategy of the programme is advocacy with the Government, particularly the Ministry of Women andChildren Affairs, to foster an enabling legal and policy framework to end child marriage. A consultative group for women’s advancement and gender equality is being formed, with representatives from Government, UN agencies and donors, to serve as a platform for advancing, for greater coordination and cross-sectoral collaboration among line ministries. Towards this end, a mapping exercise is being developed, along with a budget, for the implementation and monitoring of the National Plan of Action to End Child Marriage at the subnational level. Preparation of a National Adolescent Strategy is also under way, which will include child marriage as a child concern.

Generating and using robust data and evidence.

Evidence-based advocacy and programming are steering the design and implementation of activities to end child marriage in Bangladesh. Critical research is under way to better understand why child marriage levels are not declining, particularly in selected districts. It will also concentrate on assessing the models that have worked and how they can be scaled up and institutionalized. A qualitative analysis of social norms and social networks will facilitate an understanding of the key actors that perpetuate or challenge the social and gender norms linked to child marriage. The research will also address ways to keep girls in school and thereby reduce child marriage in rural Bangladesh and will include a needs assessment of adolescent girls (married, divorced and widowed) in urban settings. A scoping study will produce a baseline assessment of government expenditures related to child marriage at subnational levels.

Bangladesh’s programmatic response to end child marriage

Bangladesh has pledged to: End child marriage for girls under the age of 15 by 2021 and for those under the age of 18 by 2041. Reduce by at least one third the number of girls married between ages 15 and 18 by 2021.

The Prime Minister of Bangladesh has pledged to: End child marriage for girls under the age of 15 by 2021 and for those under the age of 18 by 2041. Reduce by at least one third the number of girls married between ages 15 and 18 by 2021.
