

Antigua and Barbuda

WUENIC 2024 revision,
Published 15 July 2025

WHO/UNICEF Estimates of National Immunization Coverage (WUENIC), 2024 revision

Every year, WHO and UNICEF jointly review submissions from Member States on national immunization coverage, including annual administrative and official coverage, finalized survey reports and data from both published and grey literature. The data is triangulated with consideration of potential biases and local expert opinions to differentiate between accurately reflective empirical data and potentially misleading data, to assess the most likely coverage levels for each country.

WHO and UNICEF produce country-specific estimates by individually reviewing each country's data without borrowing from other countries in the absence of data. These estimates are not based on ad hoc adjustments to reported data; sometimes, empirical data come from a single source, typically nationally reported coverage data. If no data are available for a specific country-vaccine-year combination, data from earlier and later years are considered and interpolated to fill in the gaps. When data sources are conflicting and show significant variations, efforts are made to determine the most likely estimate, taking into account potential biases in the available data.

This slide deck presents the latest WUENIC estimates (published 15 July 2025).

Definitions of immunization terms

Vaccine coverage

Percentage of infants (children under one year of age) who received certain vaccine-doses. For example, coverage of DTP3 is the percentage of infants who received all three doses of diphtheria, tetanus, and pertussis (DTP) vaccine.

Unvaccinated

An infant that did not receive the first dose of a vaccine series. The term "zero-dose" is used to describe children unvaccinated with DTP1.

Under-vaccinated

An infant who received some but not all the recommended vaccine-doses in the national schedule.

Vaccine-Doses

- Bacillus Calmette-Guerin (BCG): vaccine against tuberculosis
- Hepatitis B birth dose, given within 24 hours after birth (HepBB)
- Diphtheria, tetanus, and pertussis vaccine, first dose (DTP1) and third dose (DTP3)
- Hepatitis B vaccine, third dose (HepB3)
- *Haemophilus influenzae type b* vaccine, third dose (Hib3)
- Poliomyelitis vaccine, third dose (Polio3)
- Inactivated polio vaccine, first dose (IPV1) and second dose (IPV2): second dose is only shown for oral polio vaccine (OPV) using countries
- Measles containing vaccine, first dose (MCV1) and second dose (MCV2)
- Rotavirus vaccine, last dose (RotaC)
- Pneumococcal vaccine, third dose (PCV3)
- Yellow Fever vaccine (YFV)
- Meningococcal A vaccine (MengA)
- Human papillomavirus vaccine, first dose (HPV1) and last dose (HPVc): vaccine to protect against certain types of human papillomavirus that can lead to cancer or genital warts

The Immunization Agenda 2030 (IA2030)

The IA2030 is a global strategy endorsed by the World Health Assembly aiming to ensure everyone, everywhere, at every age benefits from vaccines for improved health and well-being by 2030. It focuses on increasing vaccine coverage, equity, sustainability and pandemic preparedness while promoting life-course immunization and integrating immunization with other health services.

Key concepts

- The World Health Organization (WHO) provides global vaccine recommendations, which are adapted by countries based on local needs. Only DTP, polio and measles-containing vaccines are used in all countries.
- DTP1 is a marker of access to routine immunization services, and when not received, serves as a proxy for identifying children who have not received any vaccinations, also known as "zero-dose" children. High DTP1 coverage indicates good access to immunization services, while low coverage suggests challenges in reaching children with essential vaccines.
- DTP3 is a widely used indicator of immunization programme performance. It reflects a country's ability to deliver routine immunization services and ensures children are protected against serious disease. DTP3 is tracked globally and serves as a key measure of a nation's vaccination efforts.
- DTP1-DTP3 drop-out measures the percentage of children who received DTP1 but not DTP3, and highlights where children are lost along the vaccination pathway, highlighting potential weaknesses in service delivery and follow-up.
- MCV1 (usually recommended between 9-12 months) assesses the ability to deliver vaccines later in infancy. It serves as a tracer for protection against measles and is a good indicator of health system performance.
- HPV vaccine protects against specific types of human papilloma virus (HPV), and is used to measure life cycle vaccination.
- Other key indicators include PCV3 and MCV2, which are used to monitor the Sustainable Development Goals (SDGs).
- Together, these indicators provide a consistent and comparable way to track immunization progress, identify missed communities and monitor global targets, including those under the Immunization Agenda 2030 (IA2030) and Sustainable Development Goals (SDGs).

Key messages

- DTP1 coverage remained constant at 99% between 2023 and 2024.
- DTP3 coverage increased 2 percentage points from 97% in 2023 to 99% in 2024.
- There were there were approximately the same number of zero-dose children in 2024. This leaves <100 children without vaccination, vulnerable to vaccine-preventable diseases and a further <100 with incomplete protection.
- Antigua and Barbuda accounted for <0.1% of zero-dose children in Latin America and the Caribbean (LACR) and <0.1% of zero-dose children globally.
- MCV1 coverage increased 3 percentage points from 94% in 2023 to 97% in 2024. There were <100 children who missed out on the first measles vaccination.
- MCV2 coverage declined 5 percentage points from 87% in 2023 to 82% in 2024.
- Last dose coverage of HPV vaccination (HPVc) among girls remained constant at 1% in 2024.

Vaccination schedule, 2024

Level	Vaccine	Dose number and age administered					
		4	1	2	3	5	6
National	DTWP (booster)	18 months					
National	DTWPHIBHEPB		2 months	4 months	6 months		
National	HEPB (pediatric)		Birth				
National	HPV (females and males)		9-13 years	+6 months	+1 year		
National	IPV		2 months	4 months			
National	MMR		12 months	18 months			
National	OPV	18 months			6 months	5 years	15 years

This table shows the 2024 national immunization schedule for routine services in Antigua and Barbuda, reported through the WHO/UNICEF Joint Reporting Form on Immunization (JRF).

Each row corresponds to a vaccine or combination vaccine, indicating whether it is delivered at the national or subnational level. The schedule outlines the number of doses and the recommended ages for administration. Only childhood and adolescent vaccines relevant to WUENIC are included.

Vaccine introduction years

Vaccine	National introduction	Risk groups
HPV (Human Papilloma Virus) vaccine	2018	
HepB birth dose	2021	
Hepatitis B vaccine	1999	
Hib (Haemophilus influenzae type B) vaccine	2000	
IPV (Inactivated polio vaccine)	2015	
IPV (Inactivated polio vaccine) 2nd dose	2015	
Malaria vaccine	Not introduced	
Measles-containing vaccine 2nd dose	1997	
Meningococcal meningitis vaccines (all strains)	Not introduced	
Mumps vaccine	1988	
PCV (Pneumococcal conjugate vaccine)	Not introduced	2016
Rotavirus vaccine	Not introduced	
Rubella vaccine	1988	
YF (Yellow fever) vaccine	Not introduced	

This table displays the year each vaccine was introduced in Antigua and Barbuda. If a vaccine has been suspended, no introduction year is shown, but if it was suspended and later reintroduced, the year of reintroduction is provided. The introduction years can reflect nationwide rollout, partial (subnational) rollout, or introduction targeted to specific risk groups or high-risk areas, as indicated in the column headers.

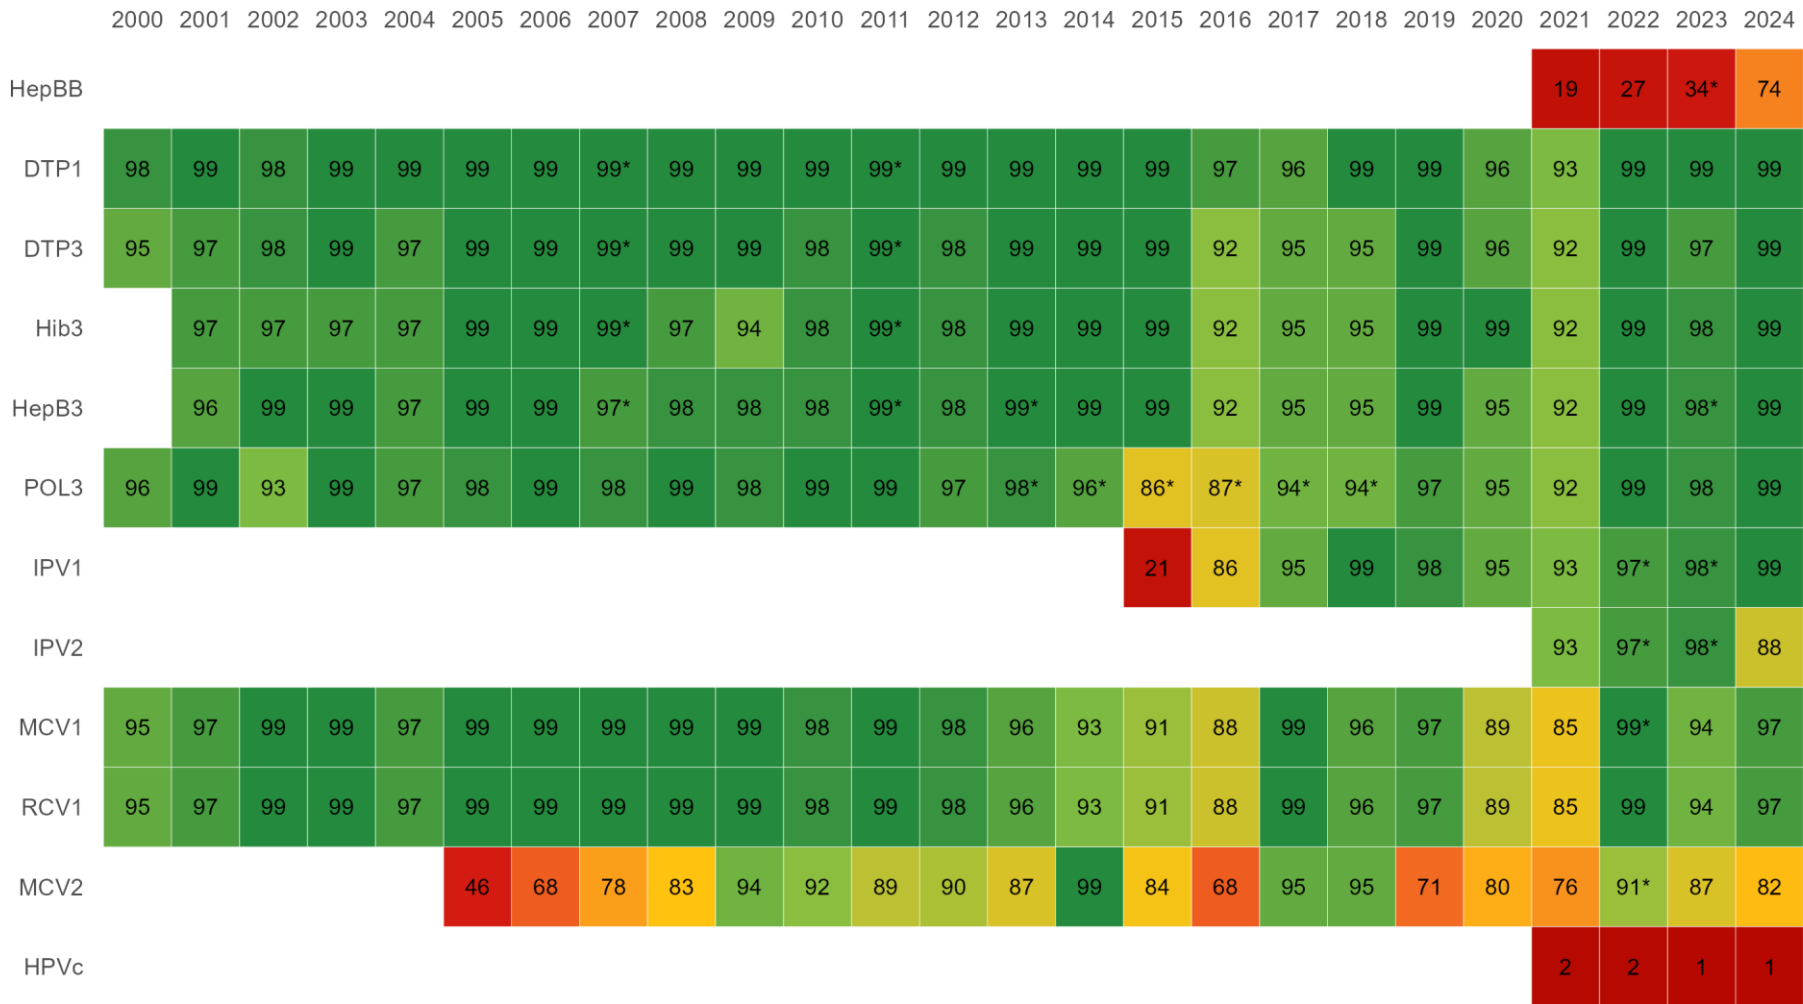

Vaccine stockouts

Vaccines / supplies	2022	2023
HepB		National (8m)
IPV	Subnational	National and subnational
MCV	National (6m) and subnational	
YFV	National (6m) and subnational	National (6m) and subnational

This table presents reported vaccine stockouts of childhood vaccines relevant to WUENIC at the national and subnational levels over the last 5 years (2020 to 2024). Where available, the duration of national-level stockouts is indicated in months. Subnational stockouts are noted without specifying duration. Only vaccines that had a stockout during the specified time period are displayed.

A stockout refers to a period when vaccine storage and distribution points (e.g., national or district stores) are fully depleted, including buffer stock, and are unable to supply vaccines to lower-level stores or facilities. It is important to note that facility-level stockouts can still occur even when upper-level stores have inventory. Stockouts, especially prolonged ones, can negatively impact immunization coverage.

Vaccine coverage, Antigua and Barbuda, 2000-2024

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision.
Note: Stock information available from 2003.
An asterisk (*) indicates where there was a vaccine stockout at the national or subnational level.

This heatmap shows trends in vaccine coverage since 2000, with green cells indicating coverage of 90% or more.

Coverage of key childhood vaccines (%), Antigua and Barbuda, 2000-2024

This chart shows coverage trends for the DTP and measles vaccines. These are key antigens for assessing national immunization programmes.

In 2024, DTP1 coverage (a proxy for access to immunization services) was 97%.

DTP3 coverage - a marker of how well countries are delivering immunization services to children - exceeded the 90% target set for 2030.

WHO recommends that countries achieve at least 95% coverage with both the first (MCV1) and second (MCV2) doses of measles-containing vaccine. MCV1 provides initial protection and MCV2 ensures long-term immunity and closes gaps in coverage.

In 2024, MCV1 coverage exceeded the 95% target and MCV2 coverage NA.

Between 2023 and 2024, 2 vaccines increased coverage, 1 declined and 1 remained the same.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision

DTP1

Estimated coverage and number of un- and under-vaccinated children for DTP, Antigua and Barbuda, 2000-2024

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
 Note: Lines show vaccine coverage and bars show number of children.
 Zero-dose children are those who did not receive DTP1.

The key goal of the Immunization Agenda 2030 is to make vaccination available to everyone, everywhere, by 2030.

This chart shows diphtheria, tetanus and pertussis-containing vaccine first (DTP1) and third dose (DTP3) coverage trends, the number of zero-dose children and DTP drop-out in Antigua and Barbuda.

In 2024, DTP1 coverage in Antigua and Barbuda remained constant 99%. There were <100 children who missed out on any DTP vaccination (zero-dose children).

DTP3 coverage increased to at 99% in 2024, leaving <100 children vulnerable to vaccine-preventable diseases.

In 2024, DTP1 coverage in Antigua and Barbuda (99%) was 10 percentage points higher than the global average (89%) and 14 percentage points higher than the average across all LACR countries (85%).

National DTP1 coverage was the same as in 2019 (99%).

The number of zero-dose children remained approximately the same (<100) as in 2019.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
 Note: Coverage difference compared to 2019 - values above zero indicate coverage higher than in 2019 and values below zero indicate coverage lower than in 2019

DTP1 coverage and ranking of number zero-dose, by country, LACR, 2024

This chart shows DTP1 coverage in countries in LACR from lowest to highest coverage, and the rank of the top 10 countries with the most zero-dose children, based on absolute numbers.

In 2024, Antigua and Barbuda ranked number 26 out of 32 countries for lowest DTP1 coverage (based on tied ranks).

Antigua and Barbuda was not in the top 10 countries with the most zero-dose children.

Note: Large cohort countries may have high numbers of zero-dose children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
Note: Bars are ranked by ascending coverage. Numbers in bubbles display top 10 rank based on absolute number of zero-dose children.

Countries ranked by number of zero-dose children, LACR, 2021-2024

This chart compares the ranking of countries in LACR based on the absolute number of zero-dose children, with rank 1 representing the country with the most zero-dose children.

In 2021, Antigua and Barbuda ranked number 30 out of 32 countries with <100 zero-dose children.

In 2024, Antigua and Barbuda ranked number 32 out of 32 countries with <100 zero-dose children.

Note: Absolute numbers of zero-dose children is based on a combination of programme performance and surviving infant target population size. Countries may climb to a higher rank despite a decline in number of zero-dose children as the ranking also depends on performance of other countries in the region.

DTP coverage (%), number of children fully, partially and unvaccinated for DTP 2000-2024 and projections to 2030 based on IA2030 target , Antigua and Barbuda

Sources: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision; United Nations, Department of Economic and Social Affairs, Population Division (2024). World Population Prospects 2024, Online Edition. Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero dose children in 2019 by half by 2030.

IA2030 calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. This chart shows the annual number of children required to be vaccinated to reach the ZD target.

IA2030 calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. This chart shows the annual number of children required to be vaccinated to reach the ZD target.

Antigua and Barbuda is projected to have a decline in the number of surviving infants by 2030. To achieve the IA2030 ZD target, current efforts would be sufficient, however, countries must strengthen beyond the targets.

Estimated number of zero-dose children, 2000-2024 and target by 2030, Antigua and Barbuda

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision

Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. Dark blue bars are the estimated number of zero-dose children in 2000-2024, light blue bar is the target number of zero-dose children by 2030. The line and points show the yearly progress and trajectory to meet the target by 2030, based on a linear decline.

IA2030 aims to leave no one behind with immunization and calls on all countries to reduce the number of zero dose children by half by 2030.

This chart shows:

- Estimated number of zero-dose children in 2000-2024 (dark blue bars)
- Zero-dose target by 2030 (light blue bar)
- Trajectory to reach the 2030 target based on a linear decline (points)

In 2024, the number of zero-dose children was approximately 38% higher than the annual number proposed to reach the target, based on a linear trajectory of decline.

Estimated DTP1 coverage, and number of vaccinated and unvaccinated children, Antigua and Barbuda, 2000-2024

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision

DTP1 coverage in 2024 (99%) was the same as in 2019 (99%).

The number of children vaccinated with DTP1 increased 5% compared to in 2019.

The number of surviving infants increased approximately 5% compared to in 2019.

In 2024, more children were vaccinated than in 2019.

In 2024, there were more surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated must increase at a faster rate than the population increases.

DTP3

In 2024, DTP3 coverage in Antigua and Barbuda (99%) was 14 percentage points higher than the global average (85%) and 17 percentage points higher than the average across all LACR countries (82%).

National DTP3 coverage was the same as in 2019 (99%).

The number of un- and undervaccinated children remained approximately the same (<100) as in 2019.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
 Note: Coverage difference compared to 2019 - values above zero indicate coverage higher than in 2019 and values below zero indicate coverage lower than in 2019

DTP3 coverage and ranking of number un- and undervaccinated, by country, LACR, 2024

This chart shows DTP3 coverage in countries in LACR from lowest to highest coverage, and the rank of the top 10 countries with the most un- and undervaccinated children, based on absolute numbers.

In 2024, Antigua and Barbuda ranked number 27 out of 32 countries for lowest DTP3 coverage (based on tied ranks).

Antigua and Barbuda was not in the top 10 countries with the most un- and undervaccinated children.

Note: Large cohort countries may have high numbers of un- and undervaccinated children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
Note: Bars are ranked by ascending coverage. Numbers in bubbles display top 10 rank based on absolute number of un- and undervaccinated children.

Estimated DTP3 coverage, and number of vaccinated and unvaccinated children, Antigua and Barbuda, 2000-2024

DTP3 coverage in 2024 (99%) was the same as in 2019 (99%).

The number of children vaccinated with DTP3 increased 5% compared to in 2019.

The number of surviving infants increased approximately 5% compared to in 2019.

In 2024, more children were vaccinated than in 2019.

In 2024, there were more surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated must increase at a faster rate than the population increases.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
Note: Unvaccinated includes zero-dose and undervaccinated children

MCV1

Estimated coverage and number of un- and under-vaccinated children for MCV, Antigua and Barbuda, 2000-2024

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
 Note: Lines show vaccine coverage and bars show number of children.

Measles, because of its high transmissibility, acts as a 'canary in the coalmine', quickly exposing any immunity gaps in the population. The coverage of measles containing vaccine (MCV) is thus often used as a tracer for protection.

The percentage of children receiving MCV1 – typically at 9 or 12 months depending on the national vaccination schedule – increased to 97%. This is similar to in 2019, where coverage was 97%.

<100 children missed their routine first dose of measles vaccine.

MCV2 is typically administered to children between 18 months and five years old. MCV2 coverage declined at 82% in 2024.

In 2024, MCV1 coverage in Antigua and Barbuda (97%) was 13 percentage points higher than the global average (84%) and 11 percentage points higher than the average across all LACR countries (86%).

National MCV1 coverage was the same as in 2019 (97%).

The number of unvaccinated children remained approximately the same (<100) as in 2019.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
 Note: Coverage difference compared to 2019 - values above zero indicate coverage higher than in 2019 and values below zero indicate coverage lower than in 2019

MCV1 coverage and ranking of number unvaccinated, by country, LACR, 2024

This chart shows MCV1 coverage in countries in LACR from lowest to highest coverage, and the rank of the top 10 countries with the most unvaccinated children, based on absolute numbers.

In 2024, Antigua and Barbuda ranked number 28 out of 32 countries for lowest MCV1 coverage (based on tied ranks).

Antigua and Barbuda was not in the top 10 countries with the most unvaccinated children.

Note: Large cohort countries may have high numbers of unvaccinated children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
Note: Bars are ranked by ascending coverage. Numbers in bubbles display top 10 rank based on absolute number of unvaccinated children.

Estimated MCV1 coverage, and number of vaccinated and unvaccinated children, Antigua and Barbuda, 2000-2024

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision

MCV1 coverage in 2024 (97%) was the same as in 2019 (97%).

The number of children vaccinated with MCV1 increased 5% compared to in 2019.

The number of surviving infants increased approximately 5% compared to in 2019.

In 2024, more children were vaccinated than in 2019.

In 2024, there were more surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated must increase at a faster rate than the population increases.

Childhood immunization: Additional charts

Zero-dose children are those who did not receive DTP1.

DTP1 and DTP3

DTP1 and MCV1

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
Drop-out classification: <5% = low, 5-10% = medium, >10% = high

Drop-out rates show the percentage of children who received DTP1, but not DTP3/MCV1. Low drop-out rates indicate high retention of children in immunization programmes.

This chart shows trends in drop-out rates between DTP1 and DTP3, and DTP1 and MCV1.

In 2024, 0% of children who received DTP1 did not receive DTP3 (left), and 2% of children who received DTP1 did not receive MCV1 (right).

The low DTP drop-out rates imply good ability to provide a complete series of vaccines early in life. The low DTP-MCV drop-out rates imply good retention in immunization programmes and ability to provide a full course of vaccines in infancy (up to one year).

In 2024, Antigua and Barbuda DTP drop-out was lower and DTP-MCV drop-out was lower than global drop-out rates, respectively.

Coverage of recommended childhood vaccines, Antigua and Barbuda, 2000-2024

This chart shows trends in coverage of selected core routine vaccines recommended in childhood.

In 2024, MCV2 had the lowest coverage (82%), followed by MCV1 (97%).

Compared to 2019, coverage of 3 vaccines remained constant (DTP1, DTP3 and MCV1) and 3 vaccines increased (IPV1, MCV2 and POL3).

Compared to 2023, coverage of one vaccine remained constant (DTP1), 4 vaccines increased (DTP3, IPV1, MCV1 and POL3), and one vaccine decreased (MCV2).

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
Note: Data labels are shown for 2000 (or first year of reporting), 2019 and 2024

Vaccine coverage (%), Antigua and Barbuda, 2000-2024

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
Numbers in the data label bubbles refer to vaccine coverage in the latest year estimates are available.

This chart shows trends in coverage of 6 vaccines (complete series).

In 2024, MCV2 had the lowest coverage of all vaccines (82%), followed by MCV1 (97%).

Coverage of 5 vaccines were the same (DTP3, HepB3, Hib3, MCV1 and Rubella) and 3 vaccines increased (IPV1, MCV2 and Polio3) compared to respective coverage in 2019.

Coverage of 7 vaccines increased (DTP3, HepB3, Hib3, IPV1, MCV1, Polio3 and Rubella), 1 vaccine was the same (HPVc), and 1 vaccine decreased (MCV2) compared to respective coverage in 2023.

Vaccine coverage (%), Antigua and Barbuda, 2019-2024

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
 Note: The grey bar spans vaccine coverage across all years 2019-2024 and the dots represent coverage in specific years.
 Coverage is shown for vaccines with data all years 2019-2024.
 Vaccine names are coloured based on if coverage is lower (red), the same as (blue) or higher (green) than in 2019

This chart shows the range of coverage across all years 2019 to 2024 (grey bars), and coverage in specific years (dots), by vaccine. The chart can be used for assessing recovery to pre-pandemic levels.

DTP1 coverage remained the same between 2019 (99%) and 2023 (99%). DTP1 coverage remained the same in 2024 (99%) compared to 2023, and was the same as in 2019. In 2019-2024, DTP1 coverage was at it's lowest level in 2021 (93%).

In 2023, 5 vaccines had lower coverage than in 2019.

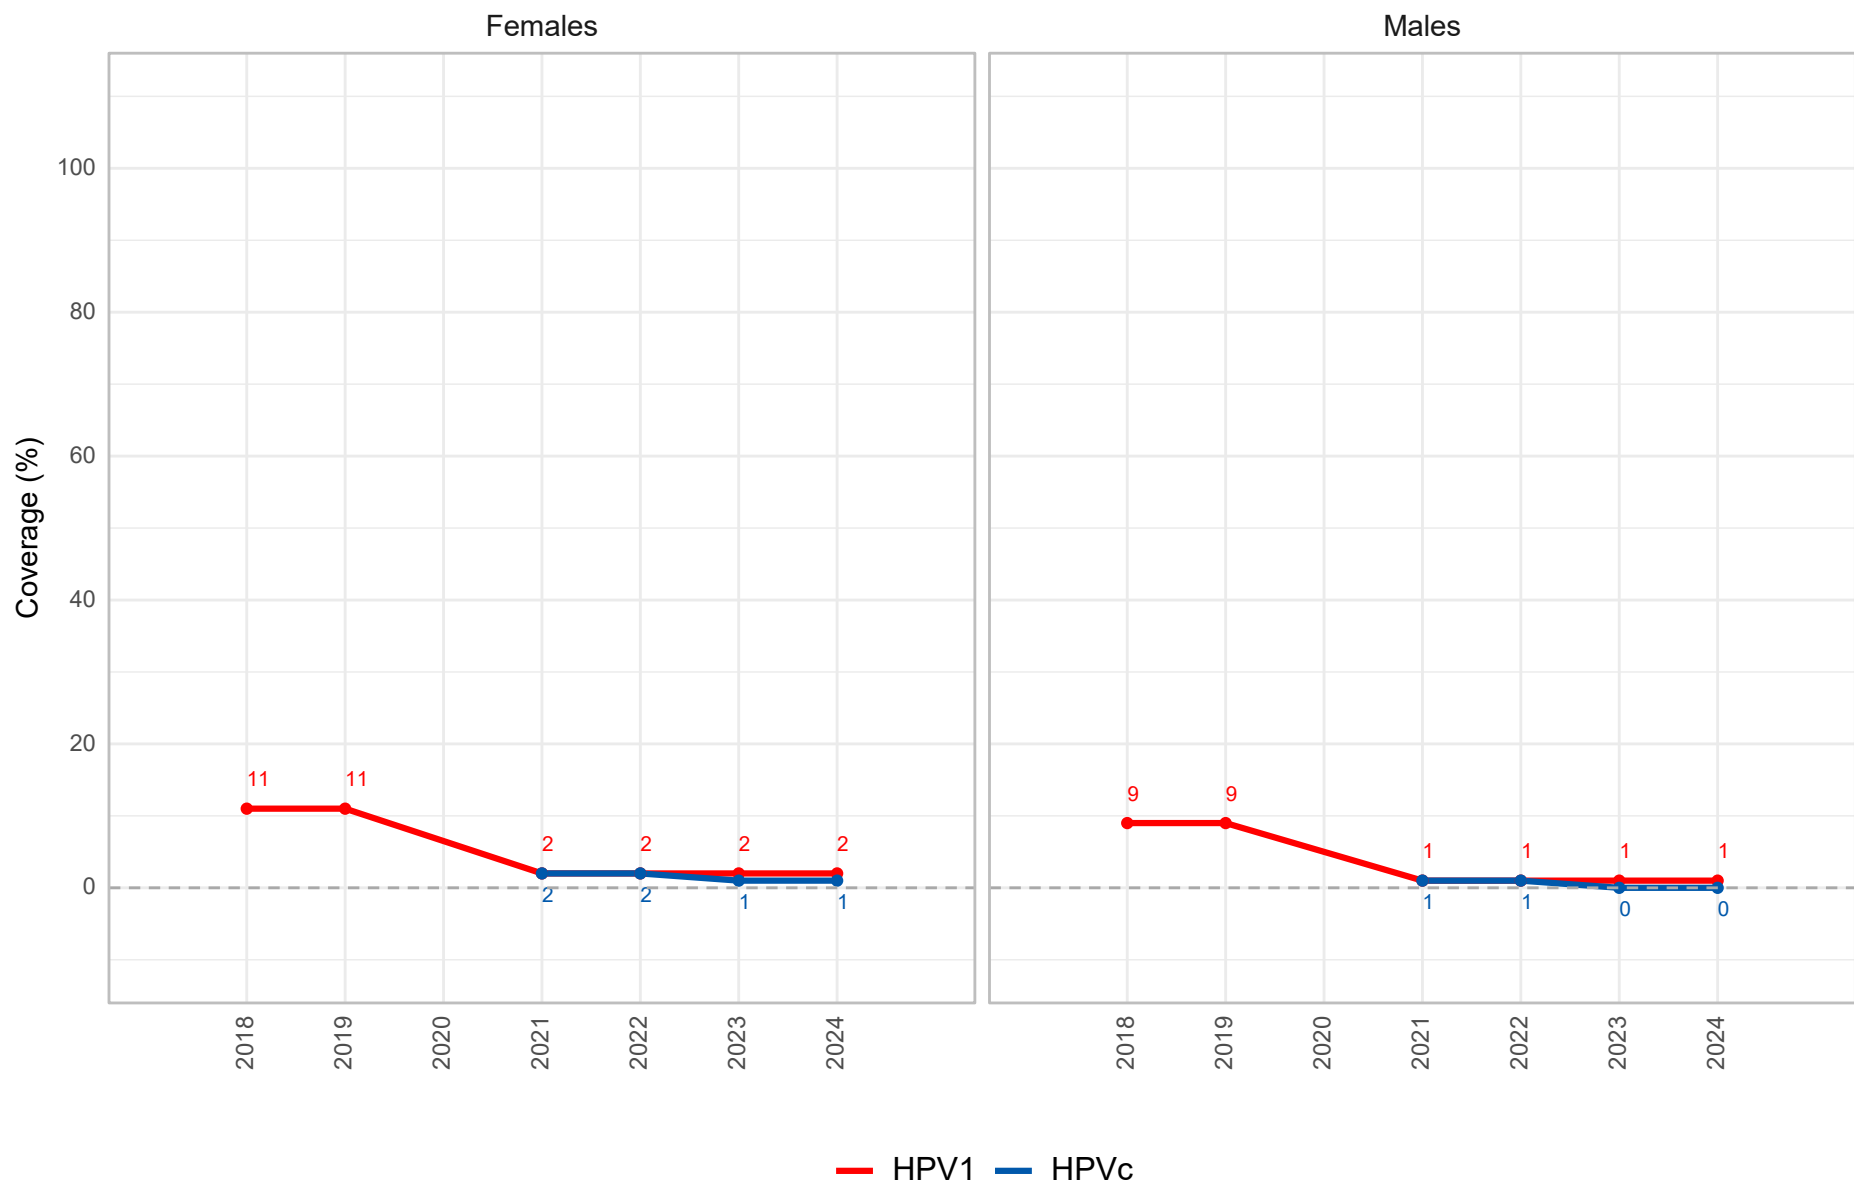

In 2024, 0 vaccines had lower coverage than in 2019.

In 2024, 1 vaccine had lower coverage than in 2023.

HPV vaccination

NA: • [Bruni et al. 2021, HPV vaccination introduction worldwide and WHO and UNICEF estimates of national HPV immunization coverage 2010–2019 \(supplementary materials\).](#)

Human papillomavirus (HPV) vaccine coverage (%), Antigua and Barbuda, 2018-2024

The first year of HPV programme coverage estimates in Antigua and Barbuda was 2018.

In 2024, first dose (HPV1) programme coverage among girls was 2% and last dose (HPVc) programme coverage was 1%.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision.
For some countries, if HPV vaccine is in the schedule, but the country did not report data in a given year, HPV programme coverage estimates are not produced.

SDG 3.b.1

SDG 3.b.1: Proportion of the target population covered by all vaccines included in their national programme, Antigua and Barbuda, 2000-2024

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2024 revision
 Note: The four vaccination coverage indicators contribute to SDG indicator 3.b.1 are: DTP3, MCV2, PCV3 and HPVc
 The Immunization Agenda 2030 (IA2030) global target is 90% coverage of all four antigens by 2030.
 Data are missing for vaccines that have not been introduced by the country or where estimates were not made (PCV3).

Four vaccination coverage indicators contribute to Sustainable Development Goal 3, indicator b.1: DTP3, PCV3, MCV2 and HPV.

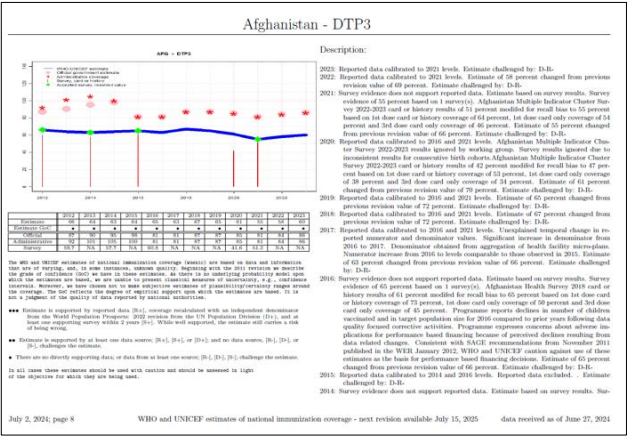

The IA2030 global target is 90% coverage of all four antigens by 2030.

Antigua and Barbuda has 3 out of the 4 SDG vaccines.

In 2024, Antigua and Barbuda had achieved at least 90% coverage of 1 out of the 4 vaccines.
