WHO/UNICEF Estimates of National Immunization Coverage (WUENIC), 2025 revision

Every year, WHO and UNICEF jointly review submissions from Member States on national immunization coverage, including annual administrative and official coverage, finalized survey reports and data from both published and grey literature. The data is triangulated with consideration of potential biases and local expert opinions to differentiate between accurately reflective empirical data and potentially misleading data, to assess the most likely coverage levels for each country.

WHO and UNICEF produce country-specific estimates by reviewing each country's data independently, without borrowing from other countries when data are missing. The estimates are not ad hoc adjustments to reported figures and may rely on a single empirical source, typically nationally reported coverage. When no data exist for a specific country-vaccine-year, earlier and later data are interpolated. If sources conflict or vary widely, the most plausible estimate is selected after considering potential biases.

This slide deck presents the latest WUENIC estimates (published 15 July 2026), using UNPD World Population Prospects (WPP 2024) for population-weighted averages and to derive absolute numbers of vaccinated and unvaccinated/zero-dose children.

Methods: • [Burton et al. 2009. WHO and UNICEF estimates of national infant immunization coverage: methods and processes.](#)

- [Burton et al. 2012. A formal representation of the WHO and UNICEF estimates of national immunization coverage: a computational logic approach.](#)
- [Brown et al. 2013. An introduction to the grade of confidence used to characterize uncertainty around the WHO and UNICEF estimates of national immunization coverage.](#)
- [Danovaro-Holliday et al. 2021. Compliance of WUENIC with Guidelines for Accurate and Transparent Health Estimates Reporting \(GATHER\) criteria.](#)

Definitions of immunization terms

Vaccine coverage

Percentage of infants (children under one year of age) who received certain vaccine-doses. For example, coverage of DTP3 is the percentage of infants who received all three doses of diphtheria, tetanus, and pertussis (DTP) vaccine.

Unvaccinated

An infant that did not receive the first dose of a vaccine series. The term zero-dose is used to describe children unvaccinated with DTP1.

Under-vaccinated

An infant who received some but not all the recommended vaccine-doses in the national schedule.

Vaccine-Doses

- Bacillus Calmette-Guerin (BCG): vaccine against tuberculosis
- Hepatitis B birth dose, given within 24 hours after birth (HepBB)
- Diphtheria, tetanus, and pertussis vaccine, first dose (DTP1) and third dose (DTP3)
- Hepatitis B vaccine, third dose (HepB3)
- Haemophilus influenzae type b vaccine, third dose (Hib3)
- Inactivated polio vaccine, first dose (IPV1) and last dose (IPVC)
- Measles containing vaccine, first dose (MCV1) and second dose (MCV2)
- Rotavirus vaccine, last dose (RotaC)
- Pneumococcal vaccine, last dose (PCVC)
- Yellow Fever vaccine (YFV)
- Meningococcal A vaccine (MengA)
- Human papillomavirus vaccine, first dose (HPV1) and last dose (HPVc): vaccine to protect against certain types of human papillomavirus that can lead to cancer or genital warts

The Immunization Agenda 2030 (IA2030)

The IA2030 is a global strategy endorsed by the World Health Assembly aiming to ensure everyone, everywhere, at every age benefits from vaccines for improved health and well-being by 2030. It focuses on increasing vaccine coverage, equity, sustainability and pandemic preparedness while promoting life-course immunization and integrating immunization with other health services.

Key concepts

- The World Health Organization (WHO) provides global vaccine recommendations, which are adapted by countries based on local needs. Only DTP, polio and measles-containing vaccines are used in all countries.
- DTP1 is a marker of access to routine immunization services, and when not received, serves as a proxy for identifying children who have not received any vaccinations, also known as "zero-dose" children. High DTP1 coverage indicates good access to immunization services, while low coverage suggests challenges in reaching children with essential vaccines.
- DTP3 is a widely used indicator of immunization programme performance. It reflects a country's ability to deliver routine immunization services and ensures children are protected against serious disease. DTP3 is tracked globally and serves as a key measure of a nation's vaccination efforts.
- DTP1-DTP3 drop-out measures the percentage of children who received DTP1 but not DTP3, and highlights where children are lost along the vaccination pathway, highlighting potential weaknesses in service delivery and follow-up.
- MCV1 (usually recommended between 9-12 months) assesses the ability to deliver vaccines later in infancy. It serves as a tracer for protection against measles and is a good indicator of health system performance.
- HPV vaccine protects against specific types of human papilloma virus (HPV), and is used to measure life cycle vaccination.
- Other key indicators include PCVC and MCV2, which are used to monitor the Sustainable Development Goals (SDGs).
- Together, these indicators provide a consistent and comparable way to track immunization progress, identify missed communities and monitor global targets, including those under the Immunization Agenda 2030 (IA2030) and Sustainable Development Goals (SDGs).

Overview

- DTP1 coverage increased 6 percentage points from 80% in 2024 to 86% in 2025.
- DTP3 coverage increased 5 percentage points from 76% in 2024 to 81% in 2025.
- In Eastern Africa, there were 765,000 fewer zero-dose children compared to in 2024. This leaves 1.9 million children without vaccination, vulnerable to vaccine-preventable diseases and a further 635,000 with only partial protection.
- In Eastern Africa, 3 countries* accounted for over half (63.6%) of all zero-dose children.
- There were 5 (36%) countries that achieved DTP3 coverage of at least 90% (IA2030 target).
- MCV1 coverage increased 4 percentage points from 73% in 2024 to 77% in 2025. There were 3.2 million children who missed out on the first measles vaccination.
- MCV2 coverage increased 6 percentage points from 59% in 2024 to 65% in 2025.
- Last dose coverage of HPV vaccination (HPVc) among girls increased from 51% to 56% in 2025.

*Ethiopia (33.6%), Tanzania (15.9%), and Sudan (14.1%)

Vaccine coverage (%), by year, Eastern Africa, 2000-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Vaccine coverage and progress varies between antigens and over time.

This heatmap shows vaccine coverage trends in Eastern Africa since 2000, with green cells indicating coverage of 90% or more.

In 2015, none of the 14 (0%) vaccines with data achieved coverage of 90% or more.

In 2025, none of the 16 (0%) vaccines achieved coverage of 90% or more.

Since 2006, estimates have been made for 6 new vaccines. IPV1 is the newest vaccine being reported (2021), which achieved 60% coverage in 2025.

Vaccine coverage, by country, Eastern Africa, 2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Countries ordered based on descending crude average coverage across all vaccines.

This heatmap shows vaccine coverage by country and vaccine in 2025.

In 2025, 7 out of 14 countries achieved coverage of 90% or higher in at least one vaccine.

Rwanda had the highest percentage of vaccines (100%) in the national immunization schedule with coverage of at least 90%, followed by Mauritius (92%).

7 countries had not achieved 90% coverage of any vaccine (Comoros, Djibouti, Ethiopia, Madagascar, Somalia, South Sudan, and Sudan).

DTP1

In 2025, DTP1 coverage was 86% and DTP3 was 81%, leaving 2.6 million children un- or under-vaccinated, including 1.9 million zero-dose and 635,000 with only partial protection.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: There may be discrepancies due to rounding.

The key goal of the Immunization Agenda 2030 is to make vaccination available to everyone, everywhere, by 2030.

This chart shows diphtheria, tetanus and pertussis-containing vaccine first (DTP1) and third dose (DTP3) coverage trends, the number of zero-dose children and DTP drop-out.

In 2025, DTP1 coverage increased at 86%. The number of children missing out on any vaccination (zero-dose children) improved from 2,701,000 in 2024 to 1,935,000 in 2025.

DTP3 coverage increased at 81% in 2025, leaving 2,570,000 children vulnerable to vaccine-preventable diseases.

In 2025, DTP1 coverage was 86%: 12 million children received at least one dose of DTP-containing vaccine, but 1.9 million remain unreachable.

DTP1 coverage in 2025 (86%) was the same as in 2019 (86%).

The number of children vaccinated with DTP1 increased 8% from 11.1 million in 2019 to 12 million in 2025.

The number of surviving infants increased approximately 9% from 12.8 million in 2019 to 13.9 million in 2025.

In 2025, 901,000 more children were vaccinated than in 2019.

In 2025, there were 1.1 million more surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated must increase at a faster rate than the population increases.

Sources: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision; United Nations, Department of Economic and Social Affairs, Population Division (2024). World Population Prospects 2024, Online Edition.

Countries ranked by number of zero-dose children, Eastern Africa, 2021-2025

This chart compares the ranking of countries in Eastern Africa based on the absolute number of zero-dose children, with rank 1 representing the country in the region with the most zero-dose children.

In 2021, Ethiopia had the highest number of zero-dose children (1,013,000), followed by Madagascar (339,000).

In 2025, Ethiopia had the highest number of zero-dose children (650,000), followed by Tanzania (307,000).

There was some change in the top 3 countries between 2021 and 2025.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Number in parentheses is the number of zero-dose children.
Zero-dose children are those who did not receive DTP1.

DTP coverage (%), number of children fully, partially and unvaccinated for DTP 2000-2025 and projections to 2030 based on IA2030 target , Eastern Africa

IA2030 calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. This chart shows the annual number of children required to be vaccinated to reach the ZD target.

Eastern Africa is projected to have a moderate increase (400,000-1 million) in the number of surviving infants by 2030. Therefore, maintaining current coverage requires vaccinating an increasing number of children.

To achieve the IA2030 ZD target, more (~2.86%) children need to be vaccinated with DTP1 each year. This will require increases in immunization programme and health system capacity.

Sources: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision; United Nations, Department of Economic and Social Affairs, Population Division (2024). World Population Prospects 2024, Online Edition.
Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero dose children in 2019 by half by 2030.

In 2025, the number of zero-dose children was 48% above the annual IA2030 milestone, putting the 2030 goal at serious risk without accelerated action.

The Immunization Agenda 2030 (IA2030) aims to leave no one behind with immunization and calls on all countries to reduce the number of zero dose children by half by 2030.

- This chart shows:
- Estimated number of zero-dose children in 2000-2024 (dark blue bars)
 - Zero-dose target by 2030 (light blue bar)
 - Trajectory to reach the 2030 target based on a linear decline (points)

In 2025, the number of zero-dose children was approximately 48% higher than the annual milestone to reach the target.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. The line and points show the yearly progress and trajectory to meet the target by 2030, based on a linear decline.

DTP1 coverage, by country, Eastern Africa, 2000-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Countries ordered based on descending coverage in 2025

This heatmap shows DTP1 coverage, by region and year. Red indicates low coverage (<60%) and green indicates high coverage (≥90%). The changing colour gradient can be used to tracked changes in coverage over time and recovery from pandemic-related disruptions where applicable.

DTP1 coverage has improved since 2000 in all regions and exceeded pre-pandemic levels in over half of regions, but progress is uneven and gaps in zero-dose children persist.

Central Africa Eastern Africa Northern Africa Southern Africa Central Africa Eastern Africa Northern Africa Southern Africa Western Africa

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Coverage difference compared to 2019 - values above zero indicate coverage higher than in 2019 and values below zero indicate coverage lower than in 2019.
There may be discrepancies in total Zero-dose children (millions) due to rounding.

In 2025, Eastern Africa ranked number 2 out of 5 AU regions, with DTP1 coverage of 86%.

DTP1 coverage (86%) was the same as in 2019 (86%).

This equates to 1.9 million zero-dose children in 2025 compared to 1.7 million zero-dose children in 2019.

DTP1 coverage improved between 2024 and 2025 in over half of regions and exceeded pre-pandemic levels in over half of regions, but progress is uneven and gaps in zero-dose children persist.

DTP1 coverage, Eastern Africa, 2018-2025

DTP1 coverage difference compared to 2019

There may be discrepancies in total Zero-dose children (millions) due to rounding.

In 2025, 6 countries achieved at least 90% DTP1 coverage, while 3 had coverage below 80%.

DTP1 Coverage (%), Eastern Africa, 2025

DTP1 coverage (%) 70-79 80-89 90-94 ≥95

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: This map is stylized and based on an approximate scale. This map does not reflect a position by UNICEF or WHO on the legal status of any country or territory or the delimitation of any frontiers.

In Eastern Africa, 3 out of 14 (21%) countries had DTP1 coverage below 80% in 2025.

There were 6 (43%) countries that achieved DTP1 of 90% or higher, accounting for 3.7 million (27%) of the total cohort.

Coverage of DTP1, by country, Eastern Africa, 2018-2025

In 2025, Seychelles had the highest coverage (99%), while Madagascar had the lowest coverage (74%).

DTP1 coverage increased in 7 out of 14 countries between 2024 and 2025. The largest increase was 35% points in Sudan from 48% to 83%.

3 countries saw a decrease in coverage (Kenya, Rwanda, and Somalia). The largest decline was 2% points in Kenya from 93% to 91%. Coverage remained constant between 2024 and 2025 in the remaining 4 countries.

In 2025, 6 out of 14 countries had achieved DTP1 coverage of at least 90%.

DTP1 coverage difference compared to 2019, by country, Eastern Africa, 2018-2025

This chart shows difference in DTP1 coverage compared to 2019, by country.

Coverage was higher in 2025 compared to 2019 in 5 countries (Eritrea, Ethiopia, Somalia, South Sudan, and Uganda).

The largest increase in coverage was 13% points in Somalia from 64% in 2019 to 77% in 2025.

Coverage was lower than in 2019 in 7 countries (Comoros, Djibouti, Kenya, Madagascar, Rwanda, Sudan, and Tanzania).

The largest decline in coverage was 16% points in Sudan from 99% in 2019 to 83% in 2025.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: Dark grey line displays regional coverage difference for reference

ence compared to 2019, values above zero indicate coverage n percentage points higher than in 2019 and values below zero indicate coverage n percentage points lower than in 2019

DTP1 coverage, by country, Eastern Africa, 2019-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: The grey bar spans vaccine coverage across all years 2019-2025 and the dots represent coverage in specific years. Countries are arranged by high to low coverage in 2025 and coloured based on if coverage is lower (red), the same as (blue) or higher (green) than in 2019. An asterisk (*) indicates countries aiming to catch-up children missed since 2019 through a Big Catch-up Plan, supported by financing from The Gavi Alliance.

This chart shows the range of DTP1 coverage across years 2019 to 2025 (grey bars), and coverage in specific years (dots), by country. The chart can be used for assessing recovery to pre-pandemic levels and progress beyond 2019.

In 2024, 7 (out of 14) countries had lower coverage than in 2019.

In 2025, 3 countries had lower DTP1 coverage than in 2024.

In 2025, 7 countries had lower coverage than in 2019.

Between 2019 and 2025, DTP1 coverage increased in five countries and decreased in seven countries.

This chart shows DTP1 coverage in 2019 and 2025, and change in coverage between the two years.

Overall, 7 out of 14 (50%) countries in Eastern Africa had a decline in coverage. The largest decline was in Sudan (-16 percentage points), followed by Tanzania (-8 percentage points).

There were 5 (36%) countries with an increase in DTP1 coverage. Coverage remained the same in 2 countries between 2019 and 2025.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Change in coverage between 2019 and 2025 indicated to the right.

Between 2024 and 2025, DTP1 coverage increased in seven countries and decreased in three countries.

This chart shows DTP1 coverage in 2024 and 2025, and change in coverage between the two years.

Overall, 3 out of 14 (21%) countries in Eastern Africa had a decline in coverage. The largest decline was in Kenya (-2 percentage points), followed by Rwanda and Somalia (-1 percentage points).

There were 7 (50%) countries with an increase in DTP1 coverage. Coverage remained the same in 4 countries between 2024 and 2025.

In 2025, Madagascar and South Sudan had the lowest DTP1 coverage, while Ethiopia and Tanzania had the highest number of zero-dose children, highlighting the need to consider both coverage and absolute numbers to identify all vulnerable populations.

This chart shows DTP1 coverage in countries in Eastern Africa from lowest to highest coverage, and the rank of the top 10 countries with the most zero-dose children, based on absolute numbers.

In 2025, DTP1 coverage ranged from 74% in Madagascar to 99% in Seychelles.

6 out of 14 (43%) countries had coverage of at least 90%.

Ethiopia had DTP1 coverage of 84% and the highest absolute number of zero-dose children in the region, followed by Tanzania.

Large cohort countries may have high numbers of zero-dose children despite high vaccine coverage. It is advantageous to look at both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not missed.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Bars are ranked by ascending coverage.
Numbers in bubbles display top 10 rank based on absolute number of zero-dose children. Number in parentheses shows number of zero-dose children.

In 2025, 3 countries accounted for over half of all zero-dose children in Eastern Africa, with Ethiopia contributing the highest share.

DTP1 unvaccinated (% of total unvaccinated)

In 2025, 3 countries accounted for over half (63.6%) of all zero-dose children in Eastern Africa.

Ethiopia had the highest number of children who did not receive DTP1 (n=650,000), which is approximately 33.6% of all zero-dose children in Eastern Africa (n=1.9 million).

The number of unvaccinated children is influenced by both the birth cohort size and programme performance. As a result, countries with large birth cohorts may still have a high number of unvaccinated children, even if coverage rates are high. At the same time, countries with high coverage will also have a greater absolute number of children who are vaccinated. Please refer to the heatmaps for country-specific coverage.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Number in legend corresponds to region ranking based on highest to lowest absolute number of unvaccinated children and reflects order of pie slices.

Approximately 75% of zero-dose children in Eastern Africa live in just 4 countries, highlighting where intensified efforts could have the greatest regional impact on zero-dose numbers.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

This chart shows the number of zero-dose children in 2025, by country in Eastern Africa. Bars are coloured based on DTP1 coverage.

In 2025, Ethiopia had the highest absolute number of zero-dose children, with 84% DTP1 coverage.

The number of unvaccinated children is influenced by both the birth cohort size and programme performance. As a result, countries with large birth cohorts may still have a high number of unvaccinated children, even if coverage rates are high. At the same time, countries with high coverage will also have a greater absolute number of children who are vaccinated. Please refer to the heatmaps for country-specific coverage.

Country trends in zero-dose children were heterogeneous, reinforcing the need to target resources and strategies to countries where the burden is increasing while sustaining gains elsewhere.

This chart shows the absolute change in number of zero-dose children, by country.

Overall, 6 countries had an increase in zero-dose children and 8 countries saw the number of zero-dose children decline between 2024 and 2025.

The three countries with the largest increase were: Kenya (104,000 $\Rightarrow$ 135,000 [+31,000]), Somalia (168,000 $\Rightarrow$ 180,000 [+11,000]), Tanzania (303,000 $\Rightarrow$ 307,000 [+4,000]).

Sudan had the largest decline in the number of zero-dose children from 838,000 in 2024 to 273,000 in 2025 (-565,000).

DTP3

In 2025, DTP3 coverage was 81%: 11.3 million children received three doses of DTP-containing vaccine, but 2.6 million remain un- or under-vaccinated.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
United Nations, Department of Economic and Social Affairs, Population Division (2024). World Population Prospects 2024, Online Edition.
Note: Unvaccinated includes zero-dose and undervaccinated children.

DTP3 coverage in 2025 (81%) was within 1% of coverage in 2019 (82%).

The number of children vaccinated with DTP3 increased 8% from 10.5 million in 2019 to 11.3 million in 2025.

The number of surviving infants increased approximately 9% from 12.8 million in 2019 to 13.9 million in 2025.

In 2025, 870,000 more children were vaccinated than in 2019.

In 2025, there were 1.1 million more surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated must increase at a faster rate than the population increases.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: This map is stylized and based on an approximate scale. This map does not reflect a position by UNICEF or WHO on the legal status of any country or territory or the delimitation of any frontiers.

In Eastern Africa, 1 out of 14 (7%) countries had DTP3 coverage below 70% in 2025. This was Madagascar, which accounts for approximately 986,000 (7%) of the total annual cohort of surviving infants in the region.

There were 5 (36%) countries that achieved DTP3 of 90% or higher, accounting for 2.2 million (16%) of the total cohort.

Coverage of DTP3, by country, Eastern Africa, 2018-2025

In 2025, Seychelles had the highest coverage (98%), while Madagascar had the lowest coverage (64%).

DTP3 coverage increased in 9 out of 14 countries between 2024 and 2025. The largest increase was 32% points in Sudan from 39% to 71%.

2 countries saw a decrease in coverage (Kenya and Rwanda). The largest decline was 3% points in Kenya from 91% to 88% and Rwanda from 98% to 95%. Coverage remained constant between 2024 and 2025 in the remaining 3 countries.

In 2025, 5 out of 14 countries had achieved DTP3 coverage of at least 90%.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: The grey bar spans vaccine coverage across all years 2019-2025 and the dots represent coverage in specific years. Countries are arranged by high to low coverage in 2025 and coloured based on if coverage is lower (red), the same as (blue) or higher (green) than in 2019. An asterisk (*) indicates countries aiming to catch-up children missed since 2019 through a Big Catch-up Plan, supported by financing from The Gavi Alliance.

This chart shows the range of DTP3 coverage across years 2019 to 2025 (grey bars), and coverage in specific years (dots), by country. The chart can be used for assessing recovery to pre-pandemic levels and progress beyond 2019.

In 2024, 8 (out of 14) countries had lower coverage than in 2019.

In 2025, 2 countries had lower DTP3 coverage than in 2024.

In 2025, 8 countries had lower coverage than in 2019.

Between 2019 and 2025, DTP3 coverage increased in five countries and decreased in eight countries.

This chart shows DTP3 coverage in 2019 and 2025, and change in coverage between the two years.

Overall, 8 out of 14 (57%) countries in Eastern Africa had a decline in coverage. The largest decline was in Sudan (-22 percentage points), followed by Tanzania (-8 percentage points).

There were 5 (36%) countries with an increase in DTP3 coverage. Coverage remained the same in 1 countries between 2019 and 2025.

Between 2024 and 2025, DTP3 coverage increased in nine countries and decreased in two countries.

This chart shows DTP3 coverage in 2024 and 2025, and change in coverage between the two years.

Overall, 2 out of 14 (14%) countries in Eastern Africa had a decline in coverage. The largest decline was in Kenya and Rwanda (-3 percentage points), followed by Comoros, South Sudan, and Tanzania (0 percentage points).

There were 9 (64%) countries with an increase in DTP3 coverage. Coverage remained the same in 3 countries between 2024 and 2025.

In 2025, Madagascar and Sudan had the lowest DTP3 coverage and were also among the countries with the highest number of un- and undervaccinated children.

This chart shows DTP3 coverage in countries in Eastern Africa from lowest to highest coverage, and the rank of the top 10 countries with the most un- and undervaccinated children, based on absolute numbers.

In 2025, DTP3 coverage ranged from 64% in Madagascar to 98% in Seychelles.

5 out of 14 (36%) countries had coverage of at least 90%.

Ethiopia had DTP3 coverage of 81% and the highest absolute number of un- and undervaccinated children in the region, followed by Sudan.

Large cohort countries may have high numbers of un- and undervaccinated children despite high vaccine coverage. It is advantageous to look at both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not missed.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Bars are ranked by ascending coverage.
Numbers in bubbles display top 10 rank based on absolute number of un- and undervaccinated children. Number in parentheses shows number of un- and undervaccinated children.

In 2025, 3 countries accounted for over half of all un- and under-vaccinated children in Eastern Africa, with Ethiopia contributing the highest share.

DTP3 unvaccinated (% of total unvaccinated)

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Number in legend corresponds to region ranking based on highest to lowest absolute number of unvaccinated children and reflects order of pie slices.

In 2025, 3 countries accounted for over half (63.8%) of all un- and under-vaccinated children in Eastern Africa.

Ethiopia had the highest number of children who did not receive DTP3 (n=772,000), which is approximately 30.1% of all un- and under-vaccinated children in Eastern Africa (n=2.6 million).

The number of unvaccinated children is influenced by both the birth cohort size and programme performance. As a result, countries with large birth cohorts may still have a high number of unvaccinated children, even if coverage rates are high. At the same time, countries with high coverage will also have a greater absolute number of children who are vaccinated. Please refer to the heatmaps for country-specific coverage.

MCV1

MCV1 coverage increased from 73% in 2024 to 77% in 2025, but this still left ~3.2 million children without any protection against measles. MCV2 coverage increased to 65% in 2025.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: There may be discrepancies due to rounding.

Measles, because of its high transmissibility, acts as a 'canary in the coalmine', quickly exposing any immunity gaps in the population. The coverage of measles containing vaccine (MCV) is thus often used as a tracer for protection.

The percentage of children receiving MCV1 – typically at 9 or 12 months – increased at 77%. This is similar to in 2019, where coverage was 78%.

3.2 million children missed their routine first dose of measles vaccine.

MCV2 is typically administered to children between 18 months and five years old. MCV2 coverage increased at 65% in 2025.

In 2025, MCV1 coverage was 77%: 10.7 million children received the measles vaccine, but 3.2 million remain unvaccinated against the highly contagious disease.

Sources: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision; United Nations, Department of Economic and Social Affairs, Population Division (2024). World Population Prospects 2024, Online Edition.

MCV1 coverage in 2025 (77%) was within 1% of coverage in 2019 (78%).

The number of children vaccinated with MCV1 increased 7% from 10 million in 2019 to 10.7 million in 2025.

The number of surviving infants increased approximately 9% from 12.8 million in 2019 to 13.9 million in 2025.

In 2025, 725,000 more children were vaccinated than in 2019.

In 2025, there were 1.1 million more surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated must increase at a faster rate than the population increases.

MCV1 coverage, by country, Eastern Africa, 2000-2025

This heatmap shows MCV1 coverage, by region and year. Red indicates low coverage (<60%) and green indicates high coverage (≥90%). The changing colour gradient can be used to tracked changes in coverage over time and recovery from pandemic-related disruptions where applicable.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Countries ordered based on descending coverage in 2025

MCV1 coverage has improved since 2000 in all regions and exceeded pre-pandemic levels in most regions, but progress is uneven and gaps in unvaccinated children persist.

Central Africa Eastern Africa Northern Africa Southern Africa Central Asia Eastern Africa Northern Africa Southern Africa Western Africa

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Coverage difference compared to 2019 - values above zero indicate coverage higher than in 2019 and values below zero indicate coverage lower than in 2019.
There may be discrepancies in total Unvaccinated children (millions) due to rounding.

In 2025, Eastern Africa ranked number 2 out of 5 AU regions, with MCV1 coverage of 77%.

MCV1 coverage (77%) was 1 percentage point lower than in 2019 (78%).

This equates to 3.2 million unvaccinated children in 2025 compared to 2.8 million unvaccinated children in 2019.

MCV1 coverage improved between 2024 and 2025 in most regions and exceeded pre-pandemic levels in most regions, but progress is uneven and gaps in unvaccinated children persist.

MCV1 coverage, Eastern Africa, 2018-2025

MCV1 coverage difference compared to 2019

Trends in the number of measles cases and MCV coverage, 2012-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision;
Reported measles and rubella cases and incidence rates by WHO Member States, as of 12 June 2026.
Provisional data based on monthly data reported to WHO (Geneva) as of 12 June 2026.

This chart shows trends in the number of measles cases and MCV coverage (Eastern Africa).

In 2025, there were 21,507 confirmed measles cases - a decrease from 39,326 in 2024.

Measles cases were reported in 12 countries (Comoros, Eritrea, Ethiopia, Kenya, Madagascar, Rwanda, South Sudan, Uganda, Tanzania, Djibouti, Somalia, and Sudan). Sudan reported the highest number of cases (n=7,644), accounting for 36% of total cases in the region.

Very high vaccination coverage is necessary to interrupt measles transmission due to the virus's high transmissibility. The WHO recommends a minimum of 95% coverage with two doses of MCV through routine immunization services.

In 2025, 5 countries achieved at least 90% MCV1 coverage, while 3 had coverage below 70%.

MCV1 Coverage (%), Eastern Africa, 2025

MCV1 coverage (%) ■ <60 ■ 60-69 ■ 70-79 ■ 80-89 ■ 90-94 ■ >=95

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: This map is stylized and based on an approximate scale. This map does not reflect a position by UNICEF or WHO on the legal status of any country or territory or the delimitation of any frontiers.

In Eastern Africa, 3 out of 14 (21%) countries had MCV1 coverage below 70% in 2025. These are Madagascar, Somalia, and Sudan.

These countries account for approximately 3.4 million (24%) of the total annual cohort of surviving infants in the region.

There were 5 (36%) countries that achieved MCV1 of 90% or higher, accounting for 2.2 million (16%) of the total cohort.

Coverage of MCV1, by country, Eastern Africa, 2018-2025

In 2025, Seychelles had the highest coverage (98%), while Madagascar had the lowest coverage (49%).

MCV1 coverage increased in 4 out of 14 countries between 2024 and 2025. The largest increase was 22% points in Sudan from 46% to 68%.

4 countries saw a decrease in coverage (Kenya, Mauritius, Rwanda, and Somalia). The largest decline was 4% points in Rwanda from 97% to 93%. Coverage remained constant between 2024 and 2025 in the remaining 6 countries.

In 2025, 5 out of 14 countries had achieved MCV1 coverage of at least 90%.

MCV1 coverage difference compared to 2019, by country, Eastern Africa, 2018-2025

This chart shows difference in MCV1 coverage compared to 2019, by country.

Coverage was higher in 2025 compared to 2019 in 4 countries (Ethiopia, Somalia, South Sudan, and Uganda).

The largest increase in coverage was 12% points in Ethiopia from 65% in 2019 to 77% in 2025.

Coverage was lower than in 2019 in 9 countries (Comoros, Djibouti, Kenya, Madagascar, Mauritius, Rwanda, Seychelles, Sudan, and Tanzania).

The largest decline in coverage was 22% points in Sudan from 90% in 2019 to 68% in 2025.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: Dark grey line displays regional coverage difference for reference compared to 2019, values above zero indicate coverage n percentage points higher than in 2019 and values below zero indicate coverage n percentage points lower than in 2019

MCV1 coverage, by country, Eastern Africa, 2019-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: The grey bar spans vaccine coverage across all years 2019-2025 and the dots represent coverage in specific years. Countries are arranged by high to low coverage in 2025 and coloured based on if coverage is lower (red), the same as (blue) or higher (green) than in 2019. An asterisk (*) indicates countries aiming to catch-up children missed since 2019 through a Big Catch-up Plan, supported by financing from The Gavi Alliance.

This chart shows the range of MCV1 coverage across years 2019 to 2025 (grey bars), and coverage in specific years (dots), by country. The chart can be used for assessing recovery to pre-pandemic levels and progress beyond 2019.

In 2024, 8 (out of 14) countries had lower coverage than in 2019.

In 2025, 4 countries had lower MCV1 coverage than in 2024.

In 2025, 9 countries had lower coverage than in 2019.

In 2025, Madagascar and Somalia had the lowest MCV1 coverage, while Ethiopia and Sudan had the highest number of unvaccinated children, highlighting the need to consider both coverage and absolute numbers to identify all vulnerable populations.

This chart shows MCV1 coverage in countries in Eastern Africa from lowest to highest coverage, and the rank of the top 10 countries with the most unvaccinated children, based on absolute numbers.

In 2025, MCV1 coverage ranged from 49% in Madagascar to 98% in Seychelles.

5 out of 14 (36%) countries had coverage of at least 90%.

Ethiopia had MCV1 coverage of 77% and the highest absolute number of unvaccinated children in the region, followed by Sudan.

Large cohort countries may have high numbers of unvaccinated children despite high vaccine coverage. It is advantageous to look at both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not missed.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Bars are ranked by ascending coverage.
Numbers in bubbles display top 10 rank based on absolute number of unvaccinated children. Number in parentheses shows number of unvaccinated children.

In 2025, 3 countries accounted for over half of all children unprotected against measles in Eastern Africa, with Ethiopia contributing the highest share.

MCV1 unvaccinated (% of total unvaccinated)

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Number in legend corresponds to region ranking based on highest to lowest absolute number of unvaccinated children and reflects order of pie slices.

In 2025, 3 countries accounted for over half (60.8%) of all children unprotected against measles in Eastern Africa.

Ethiopia had the highest number of children who did not receive MCV1 (n=935,000), which is approximately 29.1% of all children unprotected against measles in Eastern Africa (n=3.2 million).

The number of unvaccinated children is influenced by both the birth cohort size and programme performance. As a result, countries with large birth cohorts may still have a high number of unvaccinated children, even if coverage rates are high. At the same time, countries with high coverage will also have a greater absolute number of children who are vaccinated. Please refer to the heatmaps for country-specific coverage.

Childhood immunization: Additional charts

In 2025, DTP1-DTP3 drop-out was moderate (5%) and DTP1-MCV1 drop-out was high (11%) in Eastern Africa

Vaccine drop-out, Eastern Africa, 2000-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Drop-out classification: <5% = low, 5-10% = medium, >10% = high

Drop-out rates show the % of children who received DTP1, but not DTP3/MCV1. Low drop-out rates indicate high retention of children in immunization programmes.

This chart shows trends in drop-out rates between DTP1 and DTP3, and DTP1 and MCV1.

In 2025, 5% of children who received DTP1 did not receive DTP3 (left), and 11% of children who received DTP1 did not receive MCV1 (right).

The medium DTP drop-out rates imply moderate ability to provide a complete series of vaccines early in life. The high DTP-MCV drop-out rates imply poor retention in immunization programmes and ability to provide a full course of vaccines in infancy (up to one year).

In 2025, Eastern Africa DTP drop-out was NA and DTP-MCV drop-out was NA than global drop-out rates, respectively.

Drop-out between DTP1 and DTP3 (%), by country, Eastern Africa, 2018-2025

This chart shows trends in drop-out rates between DTP1 and DTP3 by country.

In 2025, Madagascar and Sudan had the highest drop-out with 14% of children who received DTP1 not receiving DTP3.

Mauritius, Seychelles, and Uganda had the lowest DTP drop-out (1%).

2 countries had DTP drop-out of more than 10%.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: Dark grey line displays regional dropout for reference

Drop-out classification: <5% = low, 5-10% = medium, >10% = high

WUENIC 2025 revision

Drop-out between DTP1 and MCV1 (%), by country, Eastern Africa, 2018-2025

This chart shows trends in drop-out rates between DTP1 and MCV1 by country.

In 2025, Madagascar had the highest drop-out with 34% of children who received DTP1 not receiving MCV1.

Mauritius had the lowest DTP-MCV drop-out (0%).

6 countries had DTP-MCV drop-out of more than 10%.#n

There were 0 countries with negative DTP-MCV dropout (ie. more children received MCV1 than DTP1).

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: Dark grey line displays regional dropout for reference

Drop-out classification: <5% = low, 5-10% = medium, >10% = high

WUENIC 2025 revision

Coverage of selected routine vaccines, Eastern Africa, 2000-2025

This chart shows coverage trends for 9 core routine vaccines recommended in childhood.

The steep increasing trends in coverage of IPV, MCV2, PCVC and RotaC is in-part related to increasing introduction in countries, along with improved coverage.

In 2025, IPV had the lowest coverage of all vaccines (60%), followed by MCV2 (65%).

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Breadth of Protection, Eastern Africa, 2000-2025

Breadth of protection (BOP) is a combination of the number of vaccines in a country's national immunization programme and the coverage achieved for each vaccine.

The radar chart displays the BOP (shaded area) and vaccine coverage (points), by year.

BOP increased from 17% in 2000 to 72% in 2025. This increase since 2000 is a result of incremental improvement in introducing new vaccines and expanding vaccination services to previously missed populations.

Enhancing BOP now depends partly on improving the coverage of RCV1, HPV, IPVc, MCV2, ROTAC, MCV1, and PCVC - vaccines with coverage less than 80% in 2025.

Breadth of protection = ((DTP3 x 3) + HepB3 + Hib3 + IPV1 + IPVc + MCV1 + MCV2 + PCV3 + RCV1 + RotaC + HPV) / 13

Breadth of protection with all recommended antigens has more than doubled since 2000, but reaching the next gains depends on closing coverage gaps in newer vaccines still below 72%.

Breadth of protection (BOP) is a combination of the number of vaccines in a country's national immunization programme and the coverage achieved for each vaccine.

The radar chart displays the BOP (shaded area) and vaccine coverage (points), by year.

BOP increased from 17% in 2000 to 72% in 2025. This increase since 2000 is a result of incremental improvement in introducing new vaccines and expanding vaccination services to previously missed populations.

Enhancing BOP now depends partly on improving the coverage of RCV1, HPV, IPVc, MCV2, ROTAC, MCV1, and PCVC - vaccines with coverage less than 80% in 2025.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Breadth of protection (BoP) = ((DTP3 x 3) + HepB3 + Hib3 + IPV1 + IPVc + MCV1 + MCV2 + PCVC + RCV1 + RotaC + HPVc) / 13

Regional average coverage masks variation between countries across all vaccines, highlighting heterogeneity in immunization performance and the need for targeted, country-specific strategies to reach underserved populations.

Vaccine coverage (%), by country, Eastern Africa, 2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Countries are ranked within each region. Country ISO codes displayed. Regional average coverage is shown in the headers and by the dashed line.

Trends in number of countries with WUENIC estimates and coverage, Eastern Africa, 2006-2025

This chart coverage progress of selected vaccines alongside number of countries with introductions to aid understanding of progress.

WUENIC starts producing estimates from the first year a country reports data. For new vaccines, this is often the year of, or the year year after a vaccine in introduced. As such, the numbers serve as a proxy for year of introduction.

As WUENIC has evolved and SAGE recommendations updated, more vaccines have been added to the estimation process. Where estimates were started after 2006, the first year of estimation is indicated by the vertical dashed line.

The total number of countries that are recommended for each vaccine is indicated by the dashed horizontal line and corresponding value.

Countries without the vaccine are included in aggregates as 0.

HPV vaccination

Methods: • [Bruni et al. 2021, HPV vaccination introduction worldwide and WHO and UNICEF estimates of national HPV immunization coverage 2010–2019 \(supplementary materials\).](#)

In 2025, HPV last dose coverage among girls increased to 56% and coverage among boys remained the same at 0%.Increases among girls are driven by new introductions, national scale up and 1-dose scheudle implementation.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Number of countries with HPV vaccination are indicated in parentheses. Countries without introduction are included in aggregates using a value of zero for the estimate.

HPV programme coverage is assessed according to the national schedule, and is used for short-term performance monitoring and SDG reporting.

In 2025, first dose (HPV1) coverage among girls remained the same at 56% and last dose (HPVc) coverage increased to 56%.

HPV1 coverage among boys remained the same at 0% and HPVc coverage remained the same at 0%.

HPV vaccine was available in 12* (out of 14) countries for girls and 2 for boys. Countries that have not introduced are included in aggregates with coverage of 0%.

Increasing coverage relies on reaching more girls and boys in existing programmes and introducing HPV vaccine in countries that have not yet introduced it.

*Includes partial introductions

HPVc programme coverage, girls, by country, Eastern Africa, 2010-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Only countries with HPV introduction and where estimates were made are displayed.
Countries without HPV vaccination are included in the aggregate with a value of 0.
Countries are ordered based on descending coverage in 2025.

The 'HPVc programme coverage' indicator is defined as the target population who received the last dose of HPV vaccine in the reporting year.

This heatmap shows HPVc programme coverage among girls, by country and year. The colour gradient is based on the best performing country.

In 2025, Tanzania had the highest HPVc coverage (99%), and Djibouti had the lowest coverage (10%).

Countries without HPV vaccine in 2025 (n=3): Somalia, South Sudan, and Sudan.

SDG 3.b.1

SDG 3.b.1: Proportion of the target population covered by all vaccines included in their national programme, 2000-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
 Note: The four vaccination coverage indicators contribute to SDG indicator 3.b.1 are: DTP3, MCV2, PCVC and HPVc
 The global target is 90% coverage of all four antigens by 2030

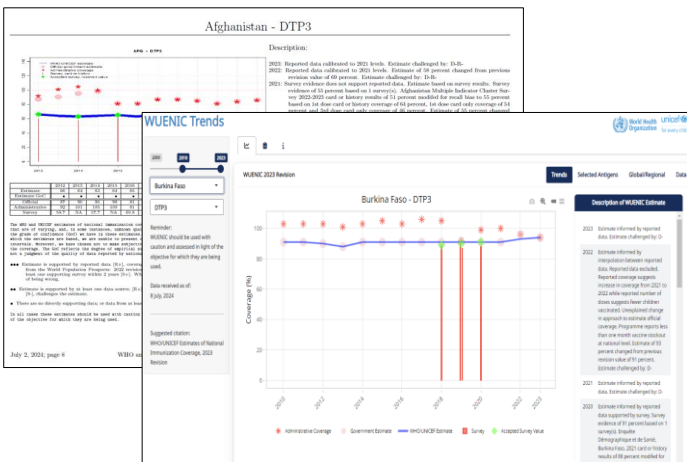

Four vaccination coverage indicators contribute to Sustainable Development Goal 3, indicator b.1: DTP3, PCVC, MCV2 and HPVc (females).

The IA2030 global target is 90% coverage of all four antigens by 2030.

In 2025, Eastern Africa had achieved at least 90% coverage of 0 out of the 4 vaccines.
