

Saint Kitts and Nevis

WUENIC 2025 revision,
Published 15 July 2026

WHO/UNICEF Estimates of National Immunization Coverage (WUENIC), 2025 revision

Every year, WHO and UNICEF jointly review submissions from Member States on national immunization coverage, including annual administrative and official coverage, finalized survey reports and data from both published and grey literature. The data is triangulated with consideration of potential biases and local expert opinions to differentiate between accurately reflective empirical data and potentially misleading data, to assess the most likely coverage levels for each country.

WHO and UNICEF produce country-specific estimates by reviewing each country's data independently, without borrowing from other countries when data are missing. The estimates are not ad hoc adjustments to reported figures and may rely on a single empirical source, typically nationally reported coverage. When no data exist for a specific country-vaccine-year, earlier and later data are interpolated. If sources conflict or vary widely, the most plausible estimate is selected after considering potential biases.

This slide deck presents the latest WUENIC estimates (published 15 July 2026), using UNPD World Population Prospects (WPP 2024) for population-weighted averages and to derive absolute numbers of vaccinated and unvaccinated/zero-dose children.

Methods: • [Burton et al. 2009. WHO and UNICEF estimates of national infant immunization coverage: methods and processes.](#)

- [Burton et al. 2012. A formal representation of the WHO and UNICEF estimates of national immunization coverage: a computational logic approach.](#)

Definitions of immunization terms

Vaccine coverage

Percentage of infants (children under one year of age) who received certain vaccine-doses. For example, coverage of DTP3 is the percentage of infants who received all three doses of diphtheria, tetanus, and pertussis (DTP) vaccine.

Unvaccinated

An infant that did not receive the first dose of a vaccine series. The term zero-dose is used to describe children unvaccinated with DTP1.

Under-vaccinated

An infant who received some but not all the recommended vaccine-doses in the national schedule.

Vaccine-Doses

- Bacillus Calmette-Guerin (BCG): vaccine against tuberculosis
- Hepatitis B birth dose, given within 24 hours after birth (HepBB)
- Diphtheria, tetanus, and pertussis vaccine, first dose (DTP1) and third dose (DTP3)
- Hepatitis B vaccine, third dose (HepB3)
- Haemophilus influenzae type b vaccine, third dose (Hib3)
- Inactivated polio vaccine, first dose (IPV1) and last dose (IPVC)
- Measles containing vaccine, first dose (MCV1) and second dose (MCV2)
- Rotavirus vaccine, last dose (RotaC)
- Pneumococcal vaccine, last dose (PCVC)
- Yellow Fever vaccine (YFV)
- Meningococcal A vaccine (MengA)
- Human papillomavirus vaccine, first dose (HPV1) and last dose (HPVc): vaccine to protect against certain types of human papillomavirus that can lead to cancer or genital warts

The Immunization Agenda 2030 (IA2030)

The IA2030 is a global strategy endorsed by the World Health Assembly aiming to ensure everyone, everywhere, at every age benefits from vaccines for improved health and well-being by 2030. It focuses on increasing vaccine coverage, equity, sustainability and pandemic preparedness while promoting life-course immunization and integrating immunization with other health services.

Key concepts

- The World Health Organization (WHO) provides global vaccine recommendations, which are adapted by countries based on local needs. Only DTP, polio and measles-containing vaccines are used in all countries.
- DTP1 is a marker of access to routine immunization services, and when not received, serves as a proxy for identifying children who have not received any vaccinations, also known as "zero-dose" children. High DTP1 coverage indicates good access to immunization services, while low coverage suggests challenges in reaching children with essential vaccines.
- DTP3 is a widely used indicator of immunization programme performance. It reflects a country's ability to deliver routine immunization services and ensures children are protected against serious disease. DTP3 is tracked globally and serves as a key measure of a nation's vaccination efforts.
- DTP1-DTP3 drop-out measures the percentage of children who received DTP1 but not DTP3, and highlights where children are lost along the vaccination pathway, highlighting potential weaknesses in service delivery and follow-up.
- MCV1 (usually recommended between 9-12 months) assesses the ability to deliver vaccines later in infancy. It serves as a tracer for protection against measles and is a good indicator of health system performance.
- HPV vaccine protects against specific types of human papilloma virus (HPV), and is used to measure life cycle vaccination.
- Other key indicators include PCVC and MCV2, which are used to monitor the Sustainable Development Goals (SDGs).
- Together, these indicators provide a consistent and comparable way to track immunization progress, identify missed communities and monitor global targets, including those under the Immunization Agenda 2030 (IA2030) and Sustainable Development Goals (SDGs).

Key messages

- DTP1 coverage increased 2 percentage points from 97% in 2024 to 99% in 2025.
- DTP3 coverage declined 2 percentage points from 97% in 2024 to 95% in 2025.
- There were there were approximately the same number of zero-dose children in 2025. This leaves <100 children without vaccination, vulnerable to vaccine-preventable diseases and a further <100 with incomplete protection.
- Saint Kitts and Nevis accounted for <0.1% of zero-dose children in Latin America and the Caribbean (LACR) and <0.1% of zero-dose children globally.
- MCV1 coverage declined 2 percentage points from 95% in 2024 to 93% in 2025. There were <100 children who missed out on the first measles vaccination.
- MCV2 coverage declined 4 percentage points from 97% in 2024 to 93% in 2025.
- Last dose coverage of HPV vaccination (HPVc) among girls decreased from 78% to 72% in 2025.

Vaccination schedule, 2025

Level	Vaccine	Dose number and age administered					
		1	2	3	4	5	6
National	BCG	Birth–11 months					
National	DTAPHIBIPV	2 months	4 months	6 months			
National	DTWP (booster)				18 months		
National	DTWPHIBHEPB	2 months	4 months	6 months			
National	HEPB (pediatric)	Birth					
National	HPV (females and males)	11 years					
National	IPV	2 months		6 months			
National	MMR	12 months	18 months				
National	OPV		4 months		18 months	4.5-5 years	16 years

This table shows the 2025 national immunization schedule for routine services in Saint Kitts and Nevis, reported through the WHO/UNICEF Joint Reporting Form on Immunization (JRF).

Each row corresponds to a vaccine or combination vaccine, indicating whether it is delivered at the national or subnational level. The schedule outlines the number of doses and the recommended ages for administration. Only childhood and adolescent vaccines relevant to WUENIC are included.

Vaccine introduction years

Vaccine	National introduction
HPV (Human papillomavirus) vaccine	2019
HepB birth dose	2015
Hepatitis B vaccine	1997
Hib (Haemophilus influenzae type B) vaccine	2000
IPV (Inactivated polio vaccine)	2015
IPV (Inactivated polio vaccine) 2nd dose	2023
Malaria vaccine	Not introduced
Measles-containing vaccine 2nd dose	1997
Meningococcal meningitis vaccines (any strain)	Not introduced
Mumps vaccine	1987
PCV (Pneumococcal conjugate vaccine)	Not introduced
RSV (Respiratory syncytial virus) immunization strategy	Not introduced
Rotavirus vaccine	Not introduced
Rubella vaccine	1987
Typhoid conjugate vaccine	Not introduced

This table displays the year each vaccine was introduced in Saint Kitts and Nevis. If a vaccine has been suspended, no introduction year is shown, but if it was suspended and later reintroduced, the year of reintroduction is provided. The introduction years can reflect nationwide rollout, partial (subnational) rollout, or introduction targeted to specific risk groups or high-risk areas, as indicated in the column headers.

In 2025, coverage increased for two antigens, remained unchanged for none, and declined for 10, indicating limited improvement in routine immunization performance; 11 achieved at least 90% coverage.

Vaccine coverage, Saint Kitts and Nevis, 2000-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision.
Note: Stock information available from 2003.
An asterisk (*) indicates where there was a vaccine stockout at the national or subnational level.

This heatmap shows trends in vaccine coverage since 2000, with green cells indicating coverage of 90% or more.

In 2025, 11 out of 12 (92%) vaccines in the schedule achieved coverage of 90% or more. Vaccine coverage ranged from 93% to 99%.

Since 2015, estimates have been made for 4 new vaccines. IPVC is the newest vaccine reported (2023), which achieved 95% coverage in 2025.

In 2025, Saint Kitts and Nevis did not report any stockouts of vaccines or supplies.

Coverage of key childhood vaccines (%), Saint Kitts and Nevis, 2000-2025

This chart shows coverage trends for the DTP and measles vaccines. These are key antigens for assessing national immunization programmes.

In 2025, DTP1 coverage (a proxy for access to immunization services) was 93%.

DTP3 coverage - a marker of how well countries are delivering immunization services to children - exceeded the 90% target set for 2030.

WHO recommends that countries achieve at least 95% coverage with both the first (MCV1) and second (MCV2) doses of measles-containing vaccine. MCV1 provides initial protection and MCV2 ensures long-term immunity and closes gaps in coverage.

In 2025, MCV1 coverage was below, but close to the 95% target and MCV2 coverage was below, but close to the 95% target.

Between 2024 and 2025, 1 vaccines increased coverage, 3 declined and 0 remained the same.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Vaccine coverage compared with other countries in the region, LACR, 2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Country ISO codes displayed. Coverage in kna shown in the headers. Regional average coverage shown by the dashed line.

DTP1

In 2025, DTP1 coverage was 99% and DTP3 was 95%, leaving <100 children un- or under-vaccinated, including <100 zero-dose and <100 with only partial protection.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Lines show vaccine coverage and bars show number of children.
Zero-dose children are those who did not receive DTP1.

The key goal of the Immunization Agenda 2030 is to make vaccination available to everyone, everywhere, by 2030.

This chart shows diphtheria, tetanus and pertussis-containing vaccine first (DTP1) and third dose (DTP3) coverage trends, the number of zero-dose children and DTP drop-out in Saint Kitts and Nevis.

In 2025, DTP1 coverage in Saint Kitts and Nevis increased to 99%. There were <100 children who missed out on any DTP vaccination (zero-dose children).

DTP3 coverage declined at at 95% in 2025, leaving <100 children vulnerable to vaccine-preventable diseases.

In 2025, Saint Kitts and Nevis DTP1 coverage was 99% - this is 2 percentage points higher than in 2019 and higher than both the global and regional averages.

In 2025, DTP1 coverage in Saint Kitts and Nevis (99%) was 9 percentage points higher than the global average (90%) and 10 percentage points higher than the average across all LACR countries (89%).

National DTP1 coverage was 2 percentage points higher than in 2019 (97%).

The number of zero-dose children remained approximately the same (<100) as in 2019.

In 2025, Saint Kitts and Nevis had the highest coverage and was not among the top 10 countries with the highest number of zero-dose children in the region.

This chart shows DTP1 coverage in countries in LACR from lowest to highest coverage, and the rank of the top 10 countries with the most zero-dose children, based on absolute numbers.

In 2025, Saint Kitts and Nevis ranked number 25 out of 33 countries for lowest DTP1 coverage (based on tied ranks).

Saint Kitts and Nevis was not in the top 10 countries with the most zero-dose children.

Note: Large cohort countries may have high numbers of zero-dose children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

Countries ranked by number of zero-dose children, LACR, 2021-2025

This chart compares the ranking of countries in the region based on the absolute number of zero-dose children, with rank 1 representing the country with the most zero-dose children.

In 2021, Saint Kitts and Nevis ranked number 33 out of 33 countries with <100 zero-dose children.

In 2025, Saint Kitts and Nevis ranked number 33 out of 33 countries with <100 zero-dose children.

Note: Absolute numbers of zero-dose children is based on a combination of programme performance and surviving infant target population size. Countries may climb to a higher rank despite a decline in number of zero-dose children as the ranking also depends on performance of other countries in the region.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Number in parentheses is the number of zero-dose children.

Saint Kitts and Nevis is on track to halve zero-dose children by 2030, but sustaining progress will require continued strengthening of immunization systems.

Sources: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision; United Nations, Department of Economic and Social Affairs, Population Division (2024). World Population Prospects 2024, Online Edition. Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero dose children in 2019 by half by 2030.

IA2030 calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. This chart shows the annual number of children required to be vaccinated to reach the ZD target.

IA2030 calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. This chart shows the annual number of children required to be vaccinated to reach the ZD target.

Saint Kitts and Nevis is projected to have a decline in the number of surviving infants by 2030. To achieve the IA2030 ZD target, current efforts would be sufficient, however, countries must strengthen beyond the targets.

In 2025, the number of zero-dose children was 63% below the annual IA2030 goal, positioning the programme to reach, and potentially exceed the 2030 goal if current progress continues.

Estimated number of zero-dose children, 2000-2025 and target by 2030, Saint Kitts and Nevis

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. Dark blue bars are the estimated number of zero-dose children in 2000-2025, light blue bar is the target number of zero-dose children by 2030. The line and points show the yearly progress and trajectory to meet the target by 2030, based on a linear decline.

IA2030 aims to leave no one behind with immunization and calls on all countries to reduce the number of zero dose children by half by 2030.

- This chart shows:
- Estimated number of zero-dose children in 2000-2025 (dark blue bars)
 - Zero-dose target by 2030 (light blue bar)
 - Trajectory to reach the 2030 target based on a linear decline (points)

In 2025, the number of zero-dose children was approximately 63% lower than (ie. the country had achieved) the annual number proposed to reach the target, based on a linear trajectory of decline.

With the number of surviving infants remaining relatively stable in recent years, coverage can be sustained by vaccinating similar numbers of children that are currently being reached, while improving coverage requires further reach.

DTP1 coverage in 2025 (99%) was higher than in 2019 (97%).

The number of children vaccinated with DTP1 decreased between 2019 and 2025.

The number of surviving infants decreased between 2019 and 2025.

In 2025, fewer children were vaccinated than in 2019.

In 2025, there were fewer surviving infants (target population) than in 2019.

DTP3

In 2025, Saint Kitts and Nevis DTP3 coverage was 95% - this is 2 percentage points lower than in 2019 and higher than both the global and regional averages.

In 2025, DTP3 coverage in Saint Kitts and Nevis (95%) was 10 percentage points higher than the global average (85%) and 12 percentage points higher than the average across all LACR countries (83%).

National DTP3 coverage was 2 percentage points lower than in 2019 (97%).

The number of un- and undervaccinated children remained approximately the same (<100) as in 2019.

In 2025, Saint Kitts and Nevis was among the countries with the highest coverage and was not among the top 10 countries with the highest number of un- and undervaccinated children in the region.

This chart shows DTP3 coverage in countries in LACR from lowest to highest coverage, and the rank of the top 10 countries with the most un- and undervaccinated children, based on absolute numbers.

In 2025, Saint Kitts and Nevis ranked number 22 out of 33 countries for lowest DTP3 coverage (based on tied ranks).

Saint Kitts and Nevis was not in the top 10 countries with the most un- and undervaccinated children.

Note: Large cohort countries may have high numbers of un- and undervaccinated children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

With the number of surviving infants remaining relatively stable in recent years, coverage can be sustained by vaccinating similar numbers of children that are currently being reached, while improving coverage requires further reach.

DTP3 coverage in 2025 (95%) was lower than in 2019 (97%).

The number of children vaccinated with DTP3 decreased between 2019 and 2025.

The number of surviving infants decreased between 2019 and 2025.

In 2025, fewer children were vaccinated than in 2019.

In 2025, there were fewer surviving infants (target population) than in 2019.

MCV1

MCV1 coverage declined at from 95% in 2024 to 93% in 2025 - below the 95% level needed to prevent outbreaks and, leaving <100 children without any protection against measles. MCV2 coverage declined at from 97% in 2024 to 93% in 2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Lines show vaccine coverage and bars show number of children.

Measles, because of its high transmissibility, acts as a 'canary in the coalmine', quickly exposing any immunity gaps in the population. The coverage of measles containing vaccine (MCV) is thus often used as a tracer for protection.

The percentage of children receiving MCV1 – typically at 9 or 12 months depending on the national vaccination schedule – declined at 93%. This is lower than in 2019, where coverage was 97%.

<100 children missed their routine first dose of measles vaccine.

MCV2 is typically administered to children between 18 months and five years old. MCV2 coverage declined at 93% in 2025.

In 2025, Saint Kitts and Nevis MCV1 coverage was 93% - this is 4 percentage points lower than in 2019 and higher than both the global and regional averages.

In 2025, MCV1 coverage in Saint Kitts and Nevis (93%) was 9 percentage points higher than the global average (84%) and 7 percentage points higher than the average across all LACR countries (86%).

National MCV1 coverage was 4 percentage points lower than in 2019 (97%).

The number of unvaccinated children remained approximately the same (<100) as in 2019.

In 2025, Saint Kitts and Nevis was among the countries with the highest coverage and was not among the top 10 countries with the highest number of unvaccinated children in the region.

This chart shows MCV1 coverage in countries in LACR from lowest to highest coverage, and the rank of the top 10 countries with the most unvaccinated children, based on absolute numbers.

In 2025, Saint Kitts and Nevis ranked number 21 out of 33 countries for lowest MCV1 coverage (based on tied ranks).

Saint Kitts and Nevis was not in the top 10 countries with the most unvaccinated children.

Note: Large cohort countries may have high numbers of unvaccinated children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

With the number of surviving infants remaining relatively stable in recent years, coverage can be sustained by vaccinating similar numbers of children that are currently being reached, while improving coverage requires further reach.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

MCV1 coverage in 2025 (93%) was lower than in 2019 (97%).

The number of children vaccinated with MCV1 decreased between 2019 and 2025.

The number of surviving infants decreased between 2019 and 2025.

In 2025, fewer children were vaccinated than in 2019.

In 2025, there were fewer surviving infants (target population) than in 2019.

Childhood immunization: Additional charts

In 2025, DTP1-DTP3 drop-out was low (4%) and DTP1-MCV1 drop-out was moderate (6%) in Saint Kitts and Nevis, indicating good ability to deliver the primary series early on, but moderate ability to provide the full course of vaccines in infancy.

Zero-dose children are those who did not receive DTP1.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Drop-out classification: <5% = low, 5-10% = medium, >10% = high

Drop-out rates show the percentage of children who received DTP1, but not DTP3/MCV1. Low drop-out rates indicate high retention of children in immunization programmes.

This chart shows trends in drop-out rates between DTP1 and DTP3, and DTP1 and MCV1.

In 2025, 4% of children who received DTP1 did not receive DTP3 (left), and 6% of children who received DTP1 did not receive MCV1 (right).

The low DTP drop-out rate implies good ability to provide a complete series of vaccines early in life. The medium DTP-MCV drop-out rate implies moderate retention in immunization programmes and ability to provide a full course of vaccines in infancy (up to one year).

In 2025, Saint Kitts and Nevis DTP drop-out was lower than the global rate, while DTP-MCV drop-out was the same as the global rate.

In 2025, Saint Kitts and Nevis had its lowest coverage in MCV1 and MCV2 (93%), while most other routine vaccines clustered around 95-99%; 4 antigens decreased since 2019, and 4 antigens decreased since 2024.

Coverage of recommended childhood vaccines, Saint Kitts and Nevis, 2000-2025

This chart shows trends in coverage of selected core routine vaccines recommended in childhood.

In 2025, MCV1 and MCV2 had the lowest coverage (93%), followed by BCG and DTP3 (95%).

Compared to 2019, coverage of 4 vaccines decreased (BCG, DTP3, MCV1 and MCV2) and 2 vaccines increased (DTP1 and IPV1).

Compared to 2024, coverage of 4 vaccines decreased (BCG, DTP3, MCV1 and MCV2) and 2 vaccines increased (DTP1 and IPV1).

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Data labels are shown for 2000 (or first year of reporting), 2019 and 2025

Vaccine coverage (%), Saint Kitts and Nevis, 2000-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Numbers in the data label bubbles refer to vaccine coverage in the latest year estimates are available.

This chart shows trends in coverage of 9 vaccines (complete series).

In 2025, HPVc had the lowest coverage of all vaccines (72%), followed by MCV1, MCV2, and Rubella (93%).

Coverage of 6 vaccines decreased (DTP3, HEPB3, HIB3, MCV1, MCV2 and RUBELLA) and 1 vaccine increased (IPV1) compared to respective coverage in 2019.

Coverage of 8 vaccines decreased (DTP3, HEPB3, HIB3, HPVc, IPVC, MCV1, MCV2 and RUBELLA) and 1 vaccine increased (IPV1) compared to respective coverage in 2024.

Vaccine coverage (%), Saint Kitts and Nevis, 2019-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
 Note: The grey bar spans vaccine coverage across all years 2019-2025 and the dots represent coverage in specific years.
 Coverage is shown for vaccines with data all years 2019-2025.
 Vaccine names are coloured based on if coverage is lower (red), the same as (blue) or higher (green) than in 2019

This chart shows the range of coverage across all years 2019 to 2025 (grey bars), and coverage in specific years (dots), by vaccine. The chart can be used for assessing recovery to pre-pandemic levels.

DTP1 coverage remained the same between 2019 (97%) and 2024 (97%). DTP1 coverage increased in 2025 (99%) compared to 2024, and was higher than in 2019. In 2019-2025, DTP1 coverage was at it's lowest level in 2022 (96%).

In 2024, 4 vaccines had lower coverage than in 2019.

In 2025, 7 vaccines had lower coverage than in 2019.

In 2025, 8 vaccines had lower coverage than in 2024.

HPV vaccination

Methods: • [Bruni et al. 2021, HPV vaccination introduction worldwide and WHO and UNICEF estimates of national HPV immunization coverage 2010–2019 \(supplementary materials\).](#)

In 2025, HPV last dose coverage among girls declined to 72% and coverage among boys declined to 68%, following switch to single dose in 2023.

Human papillomavirus (HPV) vaccine coverage (%), Saint Kitts and Nevis, 2019-2025

The first year of HPV programme coverage estimates in Saint Kitts and Nevis was 2019.

In 2025, first dose (HPV1) programme coverage among girls was 72%. In 2025, last dose (HPVc) programme coverage among girls was 72%.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision.
For some countries, if HPV vaccine is in the schedule, but the country did not report data in a given year, HPV programme coverage estimates are not produced.

SDG 3.b.1

In 2025, Saint Kitts and Nevis met the 90% SDG coverage target for DTP3 and MCV2, but not for the remaining vaccines.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: The four vaccination coverage indicators contribute to SDG indicator 3.b.1 are: DTP3, MCV2, PCVC and HPVc
The Immunization Agenda 2030 (IA2030) global target is 90% coverage of all four antigens by 2030.
Data are missing for vaccines that have not been introduced by the country or where estimates were not made (PCVC).

Four vaccination coverage indicators contribute to Sustainable Development Goal 3, indicator b.1: DTP3, PCV3, MCV2 and HPV.

The IA2030 global target is 90% coverage of all four antigens by 2030.

Saint Kitts and Nevis has 3 out of the 4 SDG vaccines.

In 2025, Saint Kitts and Nevis had achieved at least 90% coverage of 2 out of the 4 vaccines.

Short feedback questionnaire

(5 minutes)

We are seeking your feedback on the global groupings (GAVI, African Union, World Bank Income, WHO and UNICEF) and country-level PowerPoint slides developed for the release of global immunization estimates. Your input will help us understand their usefulness and identify areas for improvement.

Please take a few moments to complete this short survey and have your voice heard:

<https://forms.office.com/e/Qv1HXxxNZQ>
