WUENIC 2025 revision,
Published 15 July 2026

WHO/UNICEF Estimates of National Immunization Coverage (WUENIC), 2025 revision

Every year, WHO and UNICEF jointly review submissions from Member States on national immunization coverage, including annual administrative and official coverage, finalized survey reports and data from both published and grey literature. The data is triangulated with consideration of potential biases and local expert opinions to differentiate between accurately reflective empirical data and potentially misleading data, to assess the most likely coverage levels for each country.

WHO and UNICEF produce country-specific estimates by reviewing each country's data independently, without borrowing from other countries when data are missing. The estimates are not ad hoc adjustments to reported figures and may rely on a single empirical source, typically nationally reported coverage. When no data exist for a specific country-vaccine-year, earlier and later data are interpolated. If sources conflict or vary widely, the most plausible estimate is selected after considering potential biases.

This slide deck presents the latest WUENIC estimates (published 15 July 2026), using UNPD World Population Prospects (WPP 2024) for population-weighted averages and to derive absolute numbers of vaccinated and unvaccinated/zero-dose children.

Methods: • [Burton et al. 2009. WHO and UNICEF estimates of national infant immunization coverage: methods and processes.](#)

- [Burton et al. 2012. A formal representation of the WHO and UNICEF estimates of national immunization coverage: a computational logic approach.](#)
- [Brown et al. 2013. An introduction to the grade of confidence used to characterize uncertainty around the WHO and UNICEF estimates of national immunization coverage.](#)
- [Danovaro-Holliday et al. 2021. Compliance of WUENIC with Guidelines for Accurate and Transparent Health Estimates Reporting \(GATHER\) criteria.](#)

Definitions of immunization terms

Vaccine coverage

Percentage of infants (children under one year of age) who received certain vaccine-doses. For example, coverage of DTP3 is the percentage of infants who received all three doses of diphtheria, tetanus, and pertussis (DTP) vaccine.

Unvaccinated

An infant that did not receive the first dose of a vaccine series. The term zero-dose is used to describe children unvaccinated with DTP1.

Under-vaccinated

An infant who received some but not all the recommended vaccine-doses in the national schedule.

Vaccine-Doses

- Bacillus Calmette-Guerin (BCG): vaccine against tuberculosis
- Hepatitis B birth dose, given within 24 hours after birth (HepBB)
- Diphtheria, tetanus, and pertussis vaccine, first dose (DTP1) and third dose (DTP3)
- Hepatitis B vaccine, third dose (HepB3)
- Haemophilus influenzae type b vaccine, third dose (Hib3)
- Inactivated polio vaccine, first dose (IPV1) and last dose (IPVC)
- Measles containing vaccine, first dose (MCV1) and second dose (MCV2)
- Rotavirus vaccine, last dose (RotaC)
- Pneumococcal vaccine, last dose (PCVC)
- Yellow Fever vaccine (YFV)
- Meningococcal A vaccine (MengA)
- Human papillomavirus vaccine, first dose (HPV1) and last dose (HPVc): vaccine to protect against certain types of human papillomavirus that can lead to cancer or genital warts

The Immunization Agenda 2030 (IA2030)

The IA2030 is a global strategy endorsed by the World Health Assembly aiming to ensure everyone, everywhere, at every age benefits from vaccines for improved health and well-being by 2030. It focuses on increasing vaccine coverage, equity, sustainability and pandemic preparedness while promoting life-course immunization and integrating immunization with other health services.

Key concepts

- The World Health Organization (WHO) provides global vaccine recommendations, which are adapted by countries based on local needs. Only DTP, polio and measles-containing vaccines are used in all countries.
- DTP1 is a marker of access to routine immunization services, and when not received, serves as a proxy for identifying children who have not received any vaccinations, also known as "zero-dose" children. High DTP1 coverage indicates good access to immunization services, while low coverage suggests challenges in reaching children with essential vaccines.
- DTP3 is a widely used indicator of immunization programme performance. It reflects a country's ability to deliver routine immunization services and ensures children are protected against serious disease. DTP3 is tracked globally and serves as a key measure of a nation's vaccination efforts.
- DTP1-DTP3 drop-out measures the percentage of children who received DTP1 but not DTP3, and highlights where children are lost along the vaccination pathway, highlighting potential weaknesses in service delivery and follow-up.
- MCV1 (usually recommended between 9-12 months) assesses the ability to deliver vaccines later in infancy. It serves as a tracer for protection against measles and is a good indicator of health system performance.
- HPV vaccine protects against specific types of human papilloma virus (HPV), and is used to measure life cycle vaccination.
- Other key indicators include PCVC and MCV2, which are used to monitor the Sustainable Development Goals (SDGs).
- Together, these indicators provide a consistent and comparable way to track immunization progress, identify missed communities and monitor global targets, including those under the Immunization Agenda 2030 (IA2030) and Sustainable Development Goals (SDGs).

Key messages

- DTP1 coverage remained constant at 95% between 2024 and 2025.
- DTP3 coverage increased 6 percentage points from 88% in 2024 to 94% in 2025.
- There were <1,000 more zero-dose children in 2025. This leaves 11,000 children without vaccination, vulnerable to vaccine-preventable diseases and a further 2,000 with incomplete protection.
- Ukraine accounted for 3% of zero-dose children in Europe and Central Asia (ECAR) and 0.1% of zero-dose children globally.
- MCV1 coverage increased 5 percentage points from 91% in 2024 to 96% in 2025. There were 9,000 children who missed out on the first measles vaccination.
- MCV2 coverage increased 11 percentage point from 83% in 2024 to 94% in 2025.
- The Human papillomavirus (HPV) vaccine was not introduced.

Vaccination schedule, 2025

Level	Vaccine	Dose number and age administered					
		1	2	3	4	5	6
National	BCG	3 days					
National	DTWP		4 months	6 months			
National	DTWP (booster)				18 months		
National	DTWPHIBHEPB	2 months					
National	HEPB (pediatric)	1 day		6 months			
National	HIB		4 months	12 months			
National	IPV	2 months	4 months				
National	MMR	12 months	6 years				
National	OPV			6 months	18 months	6 years	14 years

This table shows the 2025 national immunization schedule for routine services in Ukraine, reported through the WHO/UNICEF Joint Reporting Form on Immunization (JRF).

Each row corresponds to a vaccine or combination vaccine, indicating whether it is delivered at the national or subnational level. The schedule outlines the number of doses and the recommended ages for administration. Only childhood and adolescent vaccines relevant to WUENIC are included.

Vaccine introduction years

Vaccine	National introduction	Partial introduction
HPV (Human papillomavirus) vaccine	Not introduced	
HepB birth dose	2002	
Hepatitis B vaccine	2003	2001
Hib (Haemophilus influenzae type B) vaccine	2006	
IPV (Inactivated polio vaccine)	1991	
IPV (Inactivated polio vaccine) 2nd dose	2004	
Malaria vaccine	Not introduced	
Measles-containing vaccine 2nd dose	1991	
Meningococcal meningitis vaccines (any strain)	Not introduced	
Mumps vaccine	1995	
PCV (Pneumococcal conjugate vaccine)	Not introduced	
RSV (Respiratory syncytial virus) immunization strategy	Not introduced	
Rotavirus vaccine	Not introduced	
Rubella vaccine	2003	1996
Typhoid conjugate vaccine	Not introduced	

This table displays the year each vaccine was introduced in Ukraine. If a vaccine has been suspended, no introduction year is shown, but if it was suspended and later reintroduced, the year of reintroduction is provided. The introduction years can reflect nationwide rollout, partial (subnational) rollout, or introduction targeted to specific risk groups or high-risk areas, as indicated in the column headers.

Vaccine stockouts

Vaccines / supplies	2021	2022
BCG	National (1m) and subnational	National (1m) and subnational
HepB		Subnational
IPV		Subnational
OPV		Subnational

This table presents reported vaccine stockouts of childhood vaccines relevant to WUENIC at the national and subnational levels over the last 5 years (2021 to 2025). Where available, the duration of national-level stockouts is indicated in months. Subnational stockouts are noted without specifying duration. Only vaccines that had a stockout during the specified time period are displayed.

A stockout refers to a period when vaccine storage and distribution points (e.g., national or district stores) are fully depleted, including buffer stock, and are unable to supply vaccines to lower-level stores or facilities. It is important to note that facility-level stockouts can still occur even when upper-level stores have inventory. Stockouts, especially prolonged ones, can negatively impact immunization coverage.

In 2025, coverage increased for eight antigens, remained unchanged for one, and declined for two, indicating overall progress in routine immunization performance; nine achieved at least 90% coverage.

This heatmap shows trends in vaccine coverage since 2000, with green cells indicating coverage of 90% or more.

In 2025, 9 out of 11 (82%) vaccines in the schedule achieved coverage of 90% or more. Vaccine coverage ranged from 74% to 96%.

Since 2001, estimates have been made for 5 new vaccines. IPV1 is the newest vaccine reported (2021), which achieved 89% coverage in 2025.

In 2025, Ukraine did not report any stockouts of vaccines or supplies.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision.
Note: Stock information available from 2003.
An asterisk (*) indicates where there was a vaccine stockout at the national or subnational level.

Coverage of key childhood vaccines (%), Ukraine, 2000-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

This chart shows coverage trends for the DTP and measles vaccines. These are key antigens for assessing national immunization programmes.

In 2025, DTP1 coverage (a proxy for access to immunization services) was 96%.

DTP3 coverage - a marker of how well countries are delivering immunization services to children - exceeded the 90% target set for 2030.

WHO recommends that countries achieve at least 95% coverage with both the first (MCV1) and second (MCV2) doses of measles-containing vaccine. MCV1 provides initial protection and MCV2 ensures long-term immunity and closes gaps in coverage.

In 2025, MCV1 coverage exceeded the 95% target and MCV2 coverage was below, but close to the 95% target.

Between 2024 and 2025, 3 vaccines increased coverage, 0 declined and 1 remained the same.

Vaccine coverage compared with other countries in the region, ECAR, 2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Country ISO codes displayed. Coverage in ukr shown in the headers. Regional average coverage shown by the dashed line.

DTP1

In 2025, DTP1 coverage was 95% and DTP3 was 94%, leaving 13,000 children un- or under-vaccinated, including 11,000 zero-dose and 2,000 with only partial protection.

The key goal of the Immunization Agenda 2030 is to make vaccination available to everyone, everywhere, by 2030.

This chart shows diphtheria, tetanus and pertussis-containing vaccine first (DTP1) and third dose (DTP3) coverage trends, the number of zero-dose children and DTP drop-out in Ukraine.

In 2025, DTP1 coverage in Ukraine remained constant 95%. The number of children missing out on any DTP vaccination (zero-dose children) increased from 10,000 in 2024 to 11,000 in 2025.

DTP3 coverage increased to 94% in 2025, leaving 13,000 children vulnerable to vaccine-preventable diseases.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Lines show vaccine coverage and bars show number of children.
Zero-dose children are those who did not receive DTP1.

In 2025, Ukraine DTP1 coverage was 95% - this is 6 percentage points higher than in 2019 and higher than both the global and regional averages.

In 2025, DTP1 coverage in Ukraine (95%) was 5 percentage points higher than the global average (90%) and 5 percentage points higher than the average across all ECAR countries (90%).

National DTP1 coverage was 6 percentage points higher than in 2019 (89%).

This equates to 11,000 zero-dose children in 2025 compared to 38,000 zero-dose children in 2019.

In 2025, Ukraine was among the countries with the highest coverage, but in the top 10 countries with the highest number of zero-dose children in the region.

This chart shows DTP1 coverage in countries in ECAR from lowest to highest coverage, and the rank of the top 10 countries with the most zero-dose children, based on absolute numbers.

In 2025, Ukraine ranked number 13 out of 21 countries for lowest DTP1 coverage (based on tied ranks).

Ukraine was in the top 10 countries with the most zero-dose children (rank=8).

Note: Large cohort countries may have high numbers of zero-dose children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

Countries ranked by number of zero-dose children, ECAR, 2021-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
 Note: Number in parentheses is the number of zero-dose children.

This chart compares the ranking of countries in the region based on the absolute number of zero-dose children, with rank 1 representing the country with the most zero-dose children.

In 2021, Ukraine ranked number 5 out of 21 countries with 28,000 zero-dose children.

In 2025, Ukraine ranked number 8 out of 21 countries with 11,000 zero-dose children.

Note: Absolute numbers of zero-dose children is based on a combination of programme performance and surviving infant target population size. Countries may climb to a higher rank despite a decline in number of zero-dose children as the ranking also depends on performance of other countries in the region.

Ukraine is on track to halve zero-dose children by 2030, but sustaining progress will require continued strengthening of immunization systems.

Sources: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision; United Nations, Department of Economic and Social Affairs, Population Division (2024). World Population Prospects 2024, Online Edition. Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero dose children in 2019 by half by 2030.

IA2030 calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. This chart shows the annual number of children required to be vaccinated to reach the ZD target.

IA2030 calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. This chart shows the annual number of children required to be vaccinated to reach the ZD target.

Ukraine is projected to have a decline in the number of surviving infants by 2030. To achieve the IA2030 ZD target, current efforts would be sufficient, however, countries must strengthen beyond the targets.

In 2025, the number of zero-dose children was 62% below the annual IA2030 goal, positioning the programme to reach, and potentially exceed the 2030 goal if current progress continues.

Estimated number of zero-dose children, 2000-2025 and target by 2030, Ukraine

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero dose children in 2019 by half by 2030. Dark blue bars are the estimated number of zero-dose children in 2000-2025, light blue bar is the target number of zero-dose children by 2030. The line and points show the yearly progress and trajectory to meet the target by 2030, based on a linear decline.

IA2030 aims to leave no one behind with immunization and calls on all countries to reduce the number of zero dose children by half by 2030.

- This chart shows:
- Estimated number of zero-dose children in 2000-2025 (dark blue bars)
 - Zero-dose target by 2030 (light blue bar)
 - Trajectory to reach the 2030 target based on a linear decline (points)

In 2025, the number of zero-dose children was approximately 62% lower than (ie. the country had achieved) the annual number proposed to reach the target, based on a linear trajectory of decline.

For vaccine coverage to increase, the number of children vaccinated needs to either increase or decline at a slower rate than the decline in surviving infant target population.

DTP1 coverage in 2025 (95%) was higher than in 2019 (89%).

The number of children vaccinated with DTP1 decreased 33% compared to in 2019.

The number of surviving infants decreased approximately 37% compared to in 2019.

In 2025, 100,000 fewer children were vaccinated than in 2019.

In 2025, there were 100,000 fewer surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated needs to either increase or decline at a slower rate than the decline in surviving infant target population.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

DTP3

In 2025, Ukraine DTP3 coverage was 94% - this is 14 percentage points higher than in 2019 and higher than both the global and regional averages.

In 2025, DTP3 coverage in Ukraine (94%) was 9 percentage points higher than the global average (85%) and 7 percentage points higher than the average across all ECAR countries (87%).

National DTP3 coverage was 14 percentage points higher than in 2019 (80%).

This equates to 13,000 un- and undervaccinated children in 2025 compared to 70,000 un- and undervaccinated children in 2019.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Coverage difference compared to 2019 - values above zero indicate coverage higher than in 2019 and values below zero indicate coverage lower than in 2019

In 2025, Ukraine was among the countries with the highest coverage, but in the top 10 countries with the highest number of un- and undervaccinated children in the region.

This chart shows DTP3 coverage in countries in ECAR from lowest to highest coverage, and the rank of the top 10 countries with the most un- and undervaccinated children, based on absolute numbers.

In 2025, Ukraine ranked number 14 out of 21 countries for lowest DTP3 coverage (based on tied ranks).

Ukraine was in the top 10 countries with the most un- and undervaccinated children (rank=8).

Note: Large cohort countries may have high numbers of un- and undervaccinated children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

For vaccine coverage to increase, the number of children vaccinated needs to either increase or decline at a slower rate than the decline in surviving infant target population.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Unvaccinated includes zero-dose and undervaccinated children

DTP3 coverage in 2025 (94%) was higher than in 2019 (80%).

The number of children vaccinated with DTP3 decreased 26% compared to in 2019.

The number of surviving infants decreased approximately 37% compared to in 2019.

In 2025, 100,000 fewer children were vaccinated than in 2019.

In 2025, there were 100,000 fewer surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated needs to either increase or decline at a slower rate than the decline in surviving infant target population.

MCV1

MCV1 coverage increased to from 91% in 2024 to 96% in 2025, leaving 9,000 children without any protection against measles. MCV2 coverage increased to from 83% in 2024 to 94% in 2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Lines show vaccine coverage and bars show number of children.

Measles, because of its high transmissibility, acts as a 'canary in the coalmine', quickly exposing any immunity gaps in the population. The coverage of measles containing vaccine (MCV) is thus often used as a tracer for protection.

The percentage of children receiving MCV1 – typically at 9 or 12 months depending on the national vaccination schedule – increased to 96%. This is greater than in 2019, where coverage was 93%.

9,000 children missed their routine first dose of measles vaccine.

MCV2 is typically administered to children between 18 months and five years old. MCV2 coverage increased to 94% in 2025.

In 2025, Ukraine MCV1 coverage was 96% - this is 3 percentage points higher than in 2019 and higher than both the global and regional averages.

In 2025, MCV1 coverage in Ukraine (96%) was 12 percentage points higher than the global average (84%) and 8 percentage points higher than the average across all ECAR countries (88%).

National MCV1 coverage was 3 percentage points higher than in 2019 (93%).

This equates to 9,000 unvaccinated children in 2025 compared to 24,000 unvaccinated children in 2019.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Coverage difference compared to 2019 - values above zero indicate coverage higher than in 2019 and values below zero indicate coverage lower than in 2019

In 2025, Ukraine was among the countries with the highest coverage, but in the top 10 countries with the highest number of unvaccinated children in the region.

This chart shows MCV1 coverage in countries in ECAR from lowest to highest coverage, and the rank of the top 10 countries with the most unvaccinated children, based on absolute numbers.

In 2025, Ukraine ranked number 17 out of 21 countries for lowest MCV1 coverage (based on tied ranks).

Ukraine was in the top 10 countries with the most unvaccinated children (rank=10).

Note: Large cohort countries may have high numbers of unvaccinated children despite high vaccine coverage. It is important to consider both coverage and absolute numbers of unvaccinated children to ensure vulnerable countries with small birth cohorts are not overlooked.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: Bars are ranked by ascending coverage. Numbers in bubbles display top 10 rank based on absolute number of unvaccinated children.

For vaccine coverage to increase, the number of children vaccinated needs to either increase or decline at a slower rate than the decline in surviving infant target population.

MCV1 coverage in 2025 (96%) was higher than in 2019 (93%).

The number of children vaccinated with MCV1 decreased 35% compared to in 2019.

The number of surviving infants decreased approximately 37% compared to in 2019.

In 2025, 100,000 fewer children were vaccinated than in 2019.

In 2025, there were 100,000 fewer surviving infants (target population) than in 2019.

For vaccine coverage to increase, the number of children vaccinated needs to either increase or decline at a slower rate than the decline in surviving infant target population.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision

In 2025, Ukraine experienced an increase in measles cases compared with 2024, while MCV1 coverage was 96% and MCV2 coverage was 94%.

In 2025, there was a total of 1,475 confirmed measles cases in Ukraine. In the same year, MCV1 coverage was 96% and MCV2 coverage was 94%.

The number of cases in 2025 was 3.1 times more cases than in 2024 (n=473).

The highest number of measles cases was reported in 2019 (n=57,332). In this year, MCV1 coverage was 93%.

Ukraine reported measles vaccine stockouts in 2011, 2015, 2016, and 2019.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision; Reported measles and rubella cases and incidence rates by WHO Member States, as of 12 June 2026. Provisional data based on monthly data reported to WHO (Geneva) as of 12 June 2026.
Note: Asterisks (*) indicate years with measles vaccine stockouts and carets (^) indicates years with measles vaccination campaigns (national or subnational).

Childhood immunization: Additional charts

In 2025, DTP1 and DTP3/MCV1 drop-out was low in Ukraine, indicating good retention of children in immunization programmes, and current efforts to ensure follow up are successful.

Zero-dose children are those who did not receive DTP1.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Drop-out classification: <5% = low, 5-10% = medium, >10% = high

Drop-out rates show the percentage of children who received DTP1, but not DTP3/MCV1. Low drop-out rates indicate high retention of children in immunization programmes.

This chart shows trends in drop-out rates between DTP1 and DTP3, and DTP1 and MCV1.

In 2025, 1% of children who received DTP1 did not receive DTP3 (left), and -1% of children who received DTP1 did not receive MCV1 (right).

The low DTP drop-out rate implies good ability to provide a complete series of vaccines early in life. The low DTP-MCV drop-out rate implies good retention in immunization programmes and ability to provide a full course of vaccines in infancy (up to one year).

In 2025, Ukraine DTP drop-out was lower than the global rate, while DTP-MCV drop-out was lower than the global rate.

In 2025, Ukraine had its lowest coverage in IPV1 (91%), while most other routine vaccines clustered around 92-96%; 6 antigens increased since 2019, and 4 antigens increased since 2024.

This chart shows trends in coverage of selected core routine vaccines recommended in childhood.

In 2025, IPV1 had the lowest coverage (91%), followed by BCG (92%).

Compared to 2019, coverage of 6 vaccines increased (BCG, DTP1, DTP3, IPV1, MCV1 and MCV2).

Compared to 2024, coverage of one vaccine decreased (BCG), one vaccine remained constant (DTP1), and 4 vaccines increased (DTP3, IPV1, MCV1 and MCV2).

Vaccine coverage (%), Ukraine, 2000-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Numbers in the data label bubbles refer to vaccine coverage in the latest year estimates are available.

This chart shows trends in coverage of 8 vaccines (complete series).

In 2025, IPVC had the lowest coverage of all vaccines (89%), followed by Hib3 (90%).

Coverage of 7 vaccines increased (DTP3, HEPB3, HIB3, IPV1, MCV1, MCV2 and RUBELLA) compared to respective coverage in 2019.

Coverage of 7 vaccines increased (DTP3, HEPB3, IPV1, IPVC, MCV1, MCV2 and RUBELLA) and 1 vaccine decreased (HIB3) compared to respective coverage in 2024.

Vaccine coverage (%), Ukraine, 2019-2025

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
 Note: The grey bar spans vaccine coverage across all years 2019-2025 and the dots represent coverage in specific years.
 Coverage is shown for vaccines with data all years 2019-2025.
 Vaccine names are coloured based on if coverage is lower (red), the same as (blue) or higher (green) than in 2019

This chart shows the range of coverage across all years 2019 to 2025 (grey bars), and coverage in specific years (dots), by vaccine. The chart can be used for assessing recovery to pre-pandemic levels.

DTP1 coverage increased between 2019 (89%) and 2024 (95%). DTP1 coverage remained the same in 2025 (95%) compared to 2024, and was higher than in 2019. In 2019-2025, DTP1 coverage was at it's lowest level in 2022 (78%).

In 2024, 3 vaccines had lower coverage than in 2019.

In 2025, 0 vaccines had lower coverage than in 2019.

In 2025, 2 vaccines had lower coverage than in 2024.

SDG 3.b.1

In 2025, Ukraine met the 90% SDG coverage target for all SDG vaccines.

Source: WHO/UNICEF Estimates of National Immunization Coverage, 2025 revision
Note: The four vaccination coverage indicators contribute to SDG indicator 3.b.1 are: DTP3, MCV2, PCVC and HPVc
The Immunization Agenda 2030 (IA2030) global target is 90% coverage of all four antigens by 2030.
Data are missing for vaccines that have not been introduced by the country or where estimates were not made (PCVC and HPVc).

Four vaccination coverage indicators contribute to Sustainable Development Goal 3, indicator b.1: DTP3, PCV3, MCV2 and HPV.

The IA2030 global target is 90% coverage of all four antigens by 2030.

Ukraine has 2 out of the 4 SDG vaccines.

In 2025, Ukraine had achieved at least 90% coverage of 2 out of the 4 vaccines.

*UNICEF, WHO, World Bank, Gavi and
African Union regions*

The collage features several distinct data visualization types:

- Line Charts:** Multiple charts showing trends over time. One chart is titled "Advised Coverage Flags by Vaccine and Year, 2010-2025" and shows coverage percentages for various vaccines. Another line chart shows "Number of Children Vaccinated by Vaccine and Year, 2010-2025" for vaccines like HepA, HepB, Hib, IPV, MMR, and Tdap.
- Bar Charts:** A grouped bar chart titled "Number of Children Vaccinated by Vaccine and Year, 2010-2025" displays vaccination counts for different years (2010, 2015, 2020) across various vaccines.
- Heatmaps:** Two heatmaps are present. One is titled "Coverage Trends by Vaccine and Year, 2010-2025" and uses a color scale from red (low coverage) to green (high coverage) to represent vaccination rates across different regions and years. Another heatmap shows "Number of Children Vaccinated by Vaccine and Year, 2010-2025" with a similar color scale.
- Text Boxes:** Several text boxes provide context and analysis. One discusses "Advised Coverage Flags by Vaccine and Year, 2010-2025" and mentions "coverage changes 10% from 2010". Another text box explains the "Number of Children Vaccinated by Vaccine and Year, 2010-2025" chart, noting that it shows "the number of children vaccinated by vaccine and year" and that "the number of children vaccinated by vaccine and year" is "the number of children vaccinated by vaccine and year".

Short feedback questionnaire

(5 minutes)

We are seeking your feedback on the global groupings (GAVI, African Union, World Bank Income, WHO and UNICEF) and country-level PowerPoint slides developed for the release of global immunization estimates. Your input will help us understand their usefulness and identify areas for improvement.

Please take a few moments to complete this short survey and have your voice heard:
