Countries in AMR Region

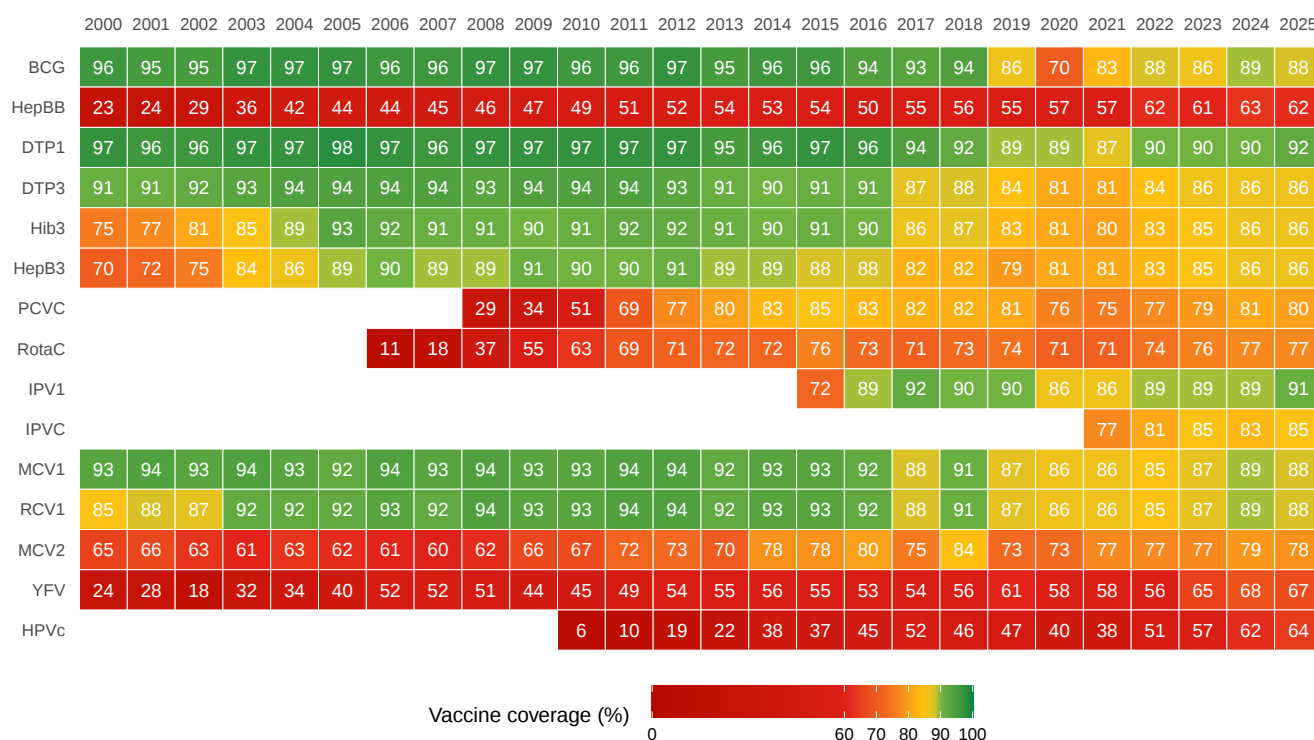

- The AMR region includes the following 35 countries: Antigua and Barbuda, Argentina, Bahamas, Barbados, Belize, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Cuba, Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, United States, Uruguay, and Venezuela.

Overview

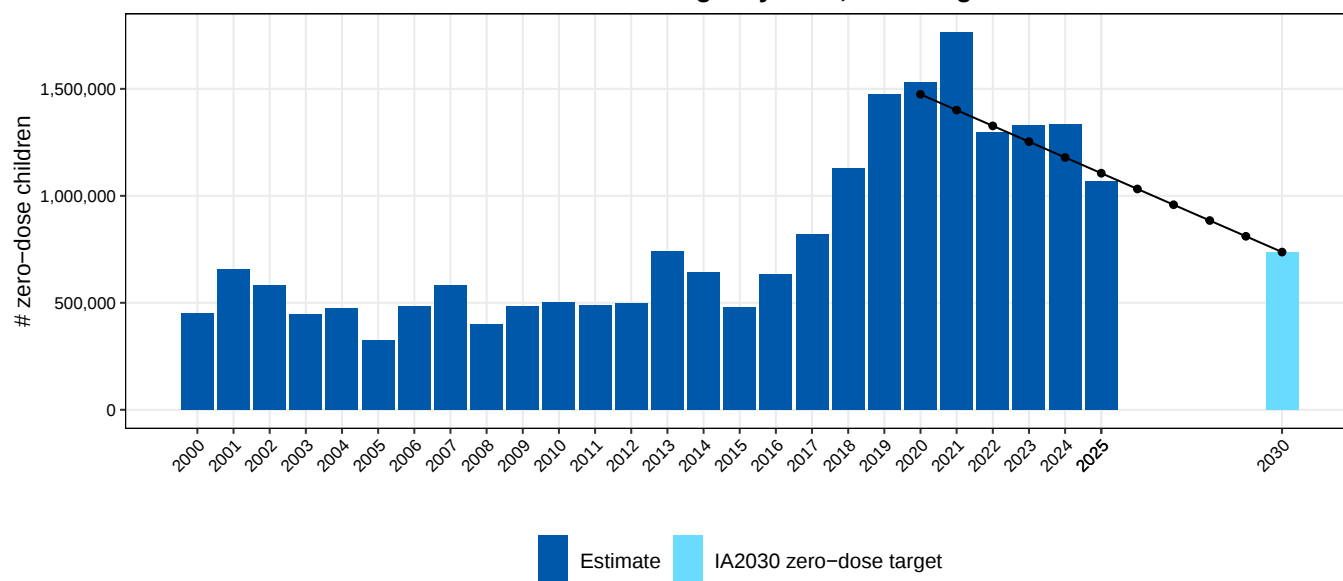

- While noting variations across countries and vaccines, 2 out of the 14 childhood vaccines achieved an average coverage of 90% or higher within the AMR region in 2025.
- Coverage of the first dose of diphtheria-tetanus-pertussis-containing vaccine (DTP1) increased from 90% in 2024 to 92% in 2025, and coverage of the third dose of DTP-containing vaccine (DTP3) was the same in 2025 as it was in 2024 (86%). Coverage of the first dose of the measles-containing vaccine (MCV1) declined from 89% in 2024 to 88% in 2025.
- A total of 27 out of 35 countries reached target coverage (90%) for all 14 antigens, representing 77% of the region.
- There were 8 countries that did not meet the target coverage across all antigens: Argentina, Bolivia, Ecuador, Haiti, Honduras, Mexico, Suriname, and Venezuela.
- In 2025, the number of zero-dose children (1.1 million) was approximately 3% lower than the annual number proposed to achieve the Immunization Agenda 2030 target of reducing the number of zero-dose children by half by 2030 in AMR region (1.1 million), based on a linear trajectory of decline.

Vaccine coverage (%), AMR Region, 2000–2025

Estimated number of zero-dose children, 2000–2025 and target by 2030, AMR Region

Source: WHO/UNICEF estimates of national immunization coverage, 2025 revision.
 Note: The Immunization Agenda 2030 (IA2030) calls on all countries to reduce the number of zero-dose children in 2019 in half by 2030. Dark blue bars are the estimated number of zero-dose children in 2000–2025, light blue bar is the target number of zero-dose children by 2030. The line and points show the yearly progress and trajectory to meet the target by 2030, based on a linear decline.

DTP1: Reaching zero-dose children

- The number of children vaccinated with DTP1 decreased 3.3% from 12.4 million in 2019 to 12 million in 2025.
- DTP1 coverage in 2025 was 92%, higher than in both 2019 (89%) and 2024 (90%).
- In 2025, the number of zero-dose children (1.1 million) was approximately 3% lower than the annual number proposed to achieve the Immunization Agenda 2030 target in AMR region (1.1 million), based on a linear trajectory of decline.
- In 2025, Mexico and Venezuela represented approximately 20% and 17% of all zero-dose children in AMR (n = 1.1 million), respectively. Mexico had the highest number of zero-dose children at 218,000, and Venezuela had the second highest at 185,000.
- In 2025, the lowest DTP1 coverage was observed in Venezuela at 57%, followed by Bolivia at 65%.
- There were 24 (69%) out of 35 countries in the region that achieved DTP1 coverage of 90% or higher in 2025.

DTP3: A marker of routine immunization service delivery to children

- The number of children vaccinated with DTP3 decreased 3.2% from 11.7 million in 2019 to 11.3 million in 2025.
- DTP3 coverage in 2025 was 86%, higher than in 2019 (84%) and the same as in 2024.
- In 2025, 6% of children who received DTP1 did not receive DTP3, which was the same as in 2019 (6%); medium dropout rates imply moderate ability to provide a complete series of vaccines early in life.
- In 2025, DTP3 coverage ranged from 50% in Venezuela to 99% in Antigua and Barbuda, Cuba, El Salvador, Guyana, and Saint Vincent and the Grenadines.
- In 2025, Brazil had DTP3 coverage of 86% and the highest absolute number of un- and undervaccinated children in the region (350,000), followed by United States with 94% coverage and 219,000 un- and undervaccinated children.

DTP3 coverage and un- or under-vaccinated children over time, AMR, 2000-2025

Dotted line shows the IA2030 target of 90% coverage
 Source: WHO/UNICEF estimates of national immunization coverage, 2025 revision.

MCV: Canary in the coal mine

- MCV1 coverage in 2025 was 88%, the same as in 2019 and 2024.
- Coverage of the second dose of the measles-containing vaccine (MCV2) in 2025 was 78%, higher than in 2019 (73%) but lower than in 2024 (79%). This still leaves 1.6 million children without any protection and another 1.3 million with only partial protection against the measles virus.
- In 2025, 5% of children who received DTP1 did not receive MCV1. This 5% dropout rate was 3 percentage points higher than in 2019 (2%) and higher than the 2024 dropout rate (1%).
- Medium DTP-MCV dropout rates imply moderate retention in immunization programmes.
- 4 countries (Bolivia, Haiti, Suriname, and Venezuela) had MCV1 coverage below 80% for all of the last 3 years.
- In 2025, United States had the highest number of children who did not receive the measles vaccine (292,000), representing approximately 18% of all children unprotected against measles in AMR (1.6 million).

HPV

- Programme coverage of the first dose of HPV vaccine (HPV1) among girls stood at 71% in 2025, which was higher than the coverage of 68% in 2024.
- Coverage of the last dose (HPVc) stood at 64% in 2025, which was higher than the coverage of 62% in 2024.
- HPVc coverage remains well below the IA2030 target of 90%, though it is trending upward.
- In 2025, there were 2.2 million girls who did not receive any HPV vaccination.
- In AMR, 33 out of 35 countries (94%) had introduced HPV vaccination by 2025.
 - WUENIC HPV coverage estimates are available for all 33 of these countries in 2025.
- The 2 countries that had not introduced HPV vaccination are Haiti and Venezuela.

HPV1 and HPVc coverage and unvaccinated females over time, AMR, 2010–2025

Appendix

WHO/UNICEF Estimates of National Immunization Coverage (WUENIC)

Each year, WHO and UNICEF review national immunization data from Member States, including administrative and official coverage, survey estimates and contextual information, and use rules-based data triangulation approach to assess coverage. Estimates are produced independently, without borrowing data from other countries, and are not based on ad hoc adjustments. In some cases, they rely on a single source, typically nationally reported coverage. When data for a specific country-vaccine-year are unavailable, values from adjacent years are interpolated or extrapolated, and conflicting sources are assessed to determine the most reliable estimate, considering potential biases and expert opinion.

Methods:

- [Burton et al. 2009. WHO and UNICEF estimates of national infant immunization coverage: methods and processes](#)
- [Burton et al. 2012. A formal representation of the WHO and UNICEF estimates of national immunization coverage: a computational logic approach](#)
- [Brown et al. 2013. An introduction to the grade of confidence used to characterize uncertainty around the WHO and UNICEF estimates of national immunization coverage](#)

These talking points present the latest WUENIC estimates (published 15 July 2026).

Definitions of immunization terms:

- Bacillus Calmette-Guerin (BCG): vaccine against tuberculosis
- Hepatitis B birth dose, given within 24 hours after birth (HepBB)
- Diphtheria, tetanus, and pertussis vaccine, first dose (DTP1) and third dose (DTP3)
- Hepatitis B vaccine, third dose (HepB3)
- Haemophilus influenzae type B vaccine, third dose (Hib3)
- Inactivated polio vaccine, first dose (IPV1) and last dose (IPVC)
- Measles containing vaccine, first dose (MCV1) and second dose (MCV2)
- Rotavirus vaccine, last dose (RotaC)
- Pneumococcal vaccine, last dose (PCV)
- Yellow Fever vaccine (YFV)
- Meningococcal A vaccine (MengA)
- Human Papillomavirus vaccine, first dose (HPV1) and last dose (HPVc)
