STATISTICAL PROFILE ON FEMALE GENITAL MUTILATION

Female genital mutilation (FGM) refers to “all procedures involving partial or total removal of the female external genitalia or other injury to the female genital organs for non-medical reasons.”¹ While the exact number of girls and women worldwide who have undergone FGM remains unknown, at least 200 million girls and women have been cut in 30 countries with representative data on prevalence. FGM is a violation of girls’ and women’s human rights and is condemned by many international treaties and conventions, as well as by national legislation in many countries. Yet, where it is practised FGM is performed in line with tradition and social norms to ensure that girls are socially accepted and marriageable, and to uphold their status and honour and that of the entire family. UNICEF works with government and civil society partners towards the elimination of FGM in countries where it is still practised.

No national decree/legislation banning FGM

WHEN AND HOW IS FGM PERFORMED?

Nearly three-quarters of adolescent girls who underwent FGM did so before the age of 5

Percentage distribution of girls aged 15 to 19 years who have undergone FGM, by age at which cutting occurred

- 0-4 years: 73
- 5-9 years: 72
- 10-14 years: 78
- 15+ years: 67
- Don’t know/missing: 79

Notes: The boundaries and the names shown and the designations used on the map do not imply official endorsement or acceptance by the United Nations. Only categories with 25 or more unweighted cases are presented. Due to rounding, some of the data presented may not add up to 100 per cent. Prevalence data for girls aged 0 to 14 reflect their current, but not final, FGM status since some girls who have not been cut may still be at risk of experiencing the practice once they reach the customary age for cutting. Therefore, the data on prevalence for girls under age 15 is actually an underestimation the true extent of the practice. Since age at cutting varies among settings, the amount of underestimation also varies and this should be kept in mind when interpreting all FGM prevalence data for this age group. ‘Health personnel’ includes doctors, nurses, midwives and other health workers; ‘Traditional practitioner’ includes traditional circumcisers, traditional birth attendants, traditional midwives and other types of traditional practitioners.

WHAT ARE THE PREVAILING ATTITUDES TOWARDS FGM?

One in three girls and women think FGM is necessary for social acceptance, while one in four think it is a religious requirement.

Percentage distribution of girls and women aged 15 to 49 years who have heard about FGM, by their attitudes about whether the practice should continue.

Among girls and women aged 15 to 49 years who have heard about FGM, the percentage who cite specific benefits or advantages for a girl to undergo the procedure.

IS THE PRACTICE OF FGM CHANGING?

There is no evidence of decline in the prevalence of FGM among girls and women in Mali, but attitudes towards the practice have slightly changed over time.

Percentage of girls and women aged 15 to 49 years who have undergone FGM, by current age.

Percentage of girls and women aged 15 to 49 years who have heard about FGM and think the practice should continue, by survey year.

Notes: N/A = not available.

INTER-COUNTRY STATISTICAL OVERVIEW

**Percentage of girls and women aged 15 to 49 years who have undergone FGM**

**Percentage of girls aged 0 to 14 years who have undergone FGM (as reported by their mothers)**

**Percentage of girls and women aged 15 to 49 years who have heard about FGM and think the practice should continue**

Notes: Data on attitudes for Yemen refer to ever-married girls and women. In Liberia, girls and women who have heard of the Sande society were asked whether they were members; this provides indirect information on FGM/C since it is performed during initiation into the society. Egypt data refer to girls aged 1 to 14 years and Indonesia data refer to girls aged 0 to 11 years. An older source is used to report on the prevalence of FGM among girls aged 0 to 14 years for Gambia (MICS 2010) and Uganda (DHS 2011) since the latest source did not collect these data. MICS data for Ghana (2011) could not be used to report on attitudes towards FGM due to the fact that information is missing for girls and women with no living daughters; data from MICS 2006 are used instead. In Liberia, only cut girls and women were asked about their attitudes towards FGM; since girls and women from practicing communities are more likely to support the practice, the level of support in this country as captured by DHS 2013 is higher than would be expected had all girls and women been asked their opinion. Prevalence data on FGM for girls and women aged 15 to 49 years and data on attitudes towards FGM are not available for Indonesia.
