BACKGROUND NOTE: Each year WHO and UNICEF jointly review reports submitted by Member States regarding national immunization coverage, finalized survey reports as well as data from the published and grey literature. Based on these data, with due consideration to potential biases and the views of local experts, WHO and UNICEF attempt to distinguish between situations where the available empirical data accurately reflect immunization system performance and those where the data are likely to be compromised and present a misleading view of immunization coverage while jointly estimating the most likely coverage levels for each country.

WHO and UNICEF estimates are country-specific; that is to say, each country’s data are reviewed individually, and data are not borrowed from other countries in the absence of data. Estimates are not based on ad hoc adjustments to reported data; in some instances empirical data are available from a single source, usually the nationally reported coverage data. In cases where no data are available for a given country/vaccine/year combination, data are considered from earlier and later years and interpolated to estimate coverage for the missing year(s). In cases where data sources are mixed and show large variation, an attempt is made to identify the most likely estimate with consideration of the possible biases in available data. For methods see:

*Brown et al. 2013. An introduction to the grade of confidence used to characterize uncertainty around published and grey literature. Based on these data, with due consideration to potential biases and the views of local experts, WHO and UNICEF attempt to distinguish between situations where the available empirical data accurately reflect immunization system performance and those where the data are likely to be compromised and present a misleading view of immunization coverage while jointly estimating the most likely coverage levels for each country.

Official coverages:

Estimated coverage reported by national authorities that reflects their administrative coverage:

Reported by national authorities and based on aggregated data from health service providers on the number of vaccinations administered during a given period (numerator data) and reported target population data (denominator data).

Official coverages may differ across countries.

Survey coverages:

Based on estimated coverage from population-based household surveys among children aged 12-23 months or 24-35 months following a review of survey methods and results. Information is based on the combination of vaccination history from documented evidence or caregiver recall. Survey results are considered for the appropriate birth cohort based on the period of data collection.

Data sources.

Administrative coverages:

Reported by national authorities and based on aggregated administrative reports from health service providers on the number of vaccinations administered during a given period (numerator data) and reported target population data (denominator data).

May be biased by inaccurate numerator and/or denominator data.

Survey coverages:

Based on estimated coverage from population-based household surveys among children aged 12-23 months or 24-35 months following a review of survey methods and results. Information is based on the combination of vaccination history from documented evidence or caregiver recall. Survey results are considered for the appropriate birth cohort based on the period of data collection.

Abbreviations:

**BCG**: percentage of births who received one dose of Bacillus Calmette Guerin vaccine.

**DTP1 / DTP3**: percentage of surviving infants who received the 1st / 3rd dose, respectively, of diphtheria and tetanus toxoid with pertussis containing vaccine.

**Pol3**: percentage of surviving infants who received the 3rd dose of polio containing vaccine. May be either oral or inactivated polio vaccine.

**IPV1**: percentage of surviving infants who received at least one dose of inactivated polio vaccine. In countries utilizing an immunization schedule recommending either (i) a primary series of three doses of oral polio vaccine (OPV) plus at least one dose of IPV where OPV is included in routine immunization and/or campaign or (ii) a sequential schedule of IPV followed by OPV, WHO and UNICEF estimates for IPV1 reflect coverage with at least one routine dose of IPV among infants <1 year of age among countries. For countries utilizing IPV containing vaccine use only, i.e., no recommended dose of OPV, the WHO and UNICEF estimate for IPV1 corresponds to coverage for the 1st dose of IPV.

Production of IPV coverage estimates, which begins in 2015, results in no change of the estimated coverage levels for the 3rd dose of polio (Pol3). For countries recommending routine immunization with a primary series of three doses of IPV alone, WHO and UNICEF estimated Pol3 coverage is equivalent to estimated coverage with three doses of IPV. For countries with a sequential schedule, estimated Pol3 coverage is based on that for the 3rd dose of polio vaccine regardless of vaccine type.

**MCV1**: percentage of surviving infants who received the 1st dose of measles containing vaccine. In countries where the national schedule recommends the 1st dose of MCV at 12 months or later based on the epidemiology of disease in the country, coverage estimates reflect the percentage of children who received the 1st dose of MCV as recommended.

**MCV2**: percentage of children who received the 2nd dose of measles containing vaccine according to the nationally recommended schedule.

**RCV1**: percentage of surviving infants who received the 1st dose of rubella containing vaccine. Coverage estimates are based on WHO and UNICEF estimates of coverage for the dose of measles containing vaccine that corresponds to the first measles-rubella combination vaccine. Nationally reported coverage of RCV is not taken into consideration nor are the data represented in the accompanying graph and data table.

**HepB**: percentage of births which received a dose of hepatitis B vaccine within 24 hours of delivery. Estimates of hepatitis B birth dose coverage are produced only for countries with a universal birth dose policy. Estimates are not produced for countries that recommend a birth dose to infants born to HepB virus-infected mothers only or where there is insufficient information to determine whether vaccination is within 24 hours of birth.

**HepB3**: percentage of surviving infants who received the 3rd dose of hepatitis B containing vaccine following the birth dose.

**HiB3**: percentage of surviving infants who received the 3rd dose of Haemophilus influenzae type b containing vaccine.

**RotaC**: percentage of surviving infants who received the final recommended dose of rotavirus vaccine, which can be either the 2nd or the 3rd dose depending on the vaccine.

**PcV3**: percentage of surviving infants who received the 3rd dose of pneumococcal conjugate vaccine. In countries where the national schedule recommends two doses during infancy and a booster dose at 12 months or later based on the epidemiology of disease in the country, coverage estimates may reflect the percentage of surviving infants who received two doses of PcV prior to the 1st birthday.

**YFV**: percentage of surviving infants who received one dose of yellow fever vaccine in countries where YFV is part of the national immunization schedule for children or is recommended in at risk areas; coverage estimates are annualized for the entire cohort of surviving infants.

However, the published material is being distributed without warranty of any kind, either expressed or implied. The responsibility for the interpretation and use of the material lies with the reader. In no event shall the World Health Organization or United Nations Children’s Fund be liable for damages arising from its use.
The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

Estimate is supported by reported data [R+], coverage recalculated with an independent denominator from the World Population Prospects: 2020 revision from the UN Population Division (D+), and at least one supporting survey within 2 years [S+]. While well supported, the estimate still carries a risk of being wrong.

Estimate is supported by at least one data source; [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-], challenges the estimate.

There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.

2020: Estimate based on coverage reported by national government. Reported data reflects stresses affecting the health system. Programme reports an eight month vaccine stock-out of disposable syringes, five months for reconstitution syringes and of unknown duration for AD syringes at national and subnational levels. No nationally representative household survey within the last 5 years. WHO and UNICEF recommend a high-quality survey to confirm reported levels of coverage. GoC=R+ D+

2019: Estimate based on coverage reported by national government. GoC=R+ D+

2018: Estimate based on coverage reported by national government. Decline of reported data likely reflects disruption of health services due to economic and humanitarian crisis. Programme reports stock-out of vaccine delivery supplies (syringes). GoC=R+ D+

2017: Estimate based on interpolation between data reported by national government. Reported data excluded because 105 percent greater than 100 percent. Programme reports four month stock-out of syringes. Programme reports six month vaccine stock-out at national level. Estimate challenged by: D-

2016: Estimate based on interpolation between data reported by national government. Reported data excluded because 120 percent greater than 100 percent. Reported data excluded due to an increase from 99 percent to 120 percent with decrease 105 percent. Estimate challenged by: D-

2015: Estimate based on coverage reported by national government. GoC=R+ D+

2014: Estimate based on interpolation between data reported by national government. Reported data excluded due to decline in reported coverage from 95 percent to 82 percent with increase to 99 percent. Reported official estimates are inconsistent with other vaccines and unexplained adjustment from the administrative coverage. Estimate challenged by: D-

2013: Estimate based on coverage reported by national government. GoC=R+ D+

2012: Estimate based on coverage reported by national government. GoC=R+ D+

2011: Estimate based on coverage reported by national government. GoC=R+ D+

2010: Estimate based on coverage reported by national government. GoC=R+ D+

2009: Estimate based on coverage reported by national government. GoC=R+ D+

WHO and UNICEF estimates of national immunization coverage - next revision available July 15, 2022

Data received as of July 6, 2021
### Venezuela (Bolivarian Republic of) - Pol3

#### Description:

2020: Estimate based on coverage reported by national government. Reported data reflects stresses affecting the health system. Programme reports an eight month vaccine stock-out of disposable syringes, five months for reconstitution syringes and of unknown duration for AD syringes at national and subnational levels. No nationally representative household survey within the last 5 years. WHO and UNICEF recommend a high-quality survey to confirm reported levels of coverage. GoC=R+ D+

2019: Estimate based on coverage reported by national government. GoC=R+ D+

2018: Estimate based on coverage reported by national government. Decline of reported data likely reflects disruption of health services due to economic and humanitarian crisis. Programme reports stock-out of vaccine delivery supplies (syringes). GoC=R+ D+

2017: Estimate based on coverage reported by national government. Programme reports four month stock-out of syringes. Programme reports five month vaccine stock-out at national level. GoC=R+ D+

2016: Estimate based on coverage reported by national government. GoC=R+ D+

2015: Estimate based on coverage reported by national government. Increase in reported administrative coverage due in part to a change in the population source. Programme is now using results from the 2011 census. GoC=R+ D+

2014: Estimate based on reported administrative data. GoC=R+ D+

2013: Estimate based on coverage reported by national government. GoC=R+ D+

2012: Estimate based on coverage reported by national government. GoC=R+ D+

2011: Estimate based on coverage reported by national government. GoC=R+ D+

2010: Estimate based on coverage reported by national government. GoC=R+ D+

2009: Estimate based on coverage reported by national government. GoC=R+ D+

---

The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

- **Estimate is supported by reported data** [R+], coverage recalculated with an independent denominator from the World Population Prospects: 2020 revision from the UN Population Division (D+), and at least one supporting survey within 2 years [S+]. While well supported, the estimate still carries a risk of being wrong.

- **Estimate is supported by at least one data source;** [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-], challenges the estimate.

- There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.

The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.
The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

- Estimate is supported by reported data [R+], coverage recalculated with an independent denominator from the World Population Prospects: 2020 revision from the UN Population Division (D+), and at least one supporting survey within 2 years [S+]. While well supported, the estimate still carries a risk of being wrong.
- Estimate is supported by at least one data source; [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-], challenges the estimate.
- There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.

### Description:

Estimates for a dose of inactivated polio vaccine (IPV) begin in 2015 following the Global Polio Eradication Initiative’s Polio Eradication and Endgame Strategic Plan: 2013-2018 which recommended at least one full dose or two fractional doses of IPV into routine immunization schedules as a strategy to mitigate the potential consequences should any re-emergence of type 2 poliovirus occur following the planned withdrawal of Sabin type 2 strains from oral polio vaccine (OPV).

2020: Estimate based on coverage reported by national government. Reported data reflects stresses affecting the health system. Programme reports an eight month vaccine stock-out of disposable syringes, five months for reconstitution syringes and of unknown duration for AD syringes at national and subnational levels. No nationally representative household survey within the last 5 years. WHO and UNICEF recommend a high-quality survey to confirm reported levels of coverage. Estimate based on reported data. GoC=R+ D+

2019: Estimate based on coverage reported by national government. GoC=R+ D+

2018: Estimate based on coverage reported by national government. Decline of reported data likely reflects disruption of health services due to economic and humanitarian crisis. Programme reports stock-out of vaccine delivery supplies (syringes). GoC=R+ D+

2017: Estimate based on coverage reported by national government. Programme reports four month stock-out of syringes. Programme reports six month vaccine stock-out at national level. GoC=R+ D+

2016: Estimate based on coverage reported by national government. IPV introduced in 2016. Programme reports 4 month stock-outs. GoC=R+ D+
The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. ---

July 8, 2021; page 9 WHO and UNICEF estimates of national immunization coverage - next revision available July 15, 2022 data received as of July 6, 2021
The WHO and UNICEF estimates of national immunization coverage \( (\text{wuenic}) \) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence \( (\text{GoC}) \) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

For this revision, coverage estimates for the first dose of rubella containing vaccine are based on WHO and UNICEF estimates of coverage of measles containing vaccine. Nationally reported coverage of rubella containing vaccine is not taken into consideration nor are they represented in the accompanying graph and data table.

### Description:

#### 2020:
Estimate based on estimated MCV1. Reported data reflects stresses affecting the health system. Programme reports an eight month vaccine stock-out of disposable syringes, five months for reconstitution syringes and of unknown duration for AD syringes at national and subnational levels. No nationally representative household survey within the last 5 years. WHO and UNICEF recommend a high-quality survey to confirm reported levels of coverage. GoC=R+ D+

#### 2019:
Estimate based on estimated MCV1. GoC=R+ D+

#### 2018:
Estimate based on estimated MCV1. Programme reports six month vaccine stock-out at national level. Decline of reported data likely reflects disruption of health services due to economic and humanitarian crisis. Programme reports stock-out of vaccine delivery supplies (syringes). GoC=R+ D+

#### 2017:
Estimate based on estimated MCV1. Programme reports four month stock-out of syringes. GoC=R+ D+

#### 2016:
Estimate based on estimated MCV1. GoC=R+ D+

#### 2015:
Estimate based on estimated MCV1. GoC=R+ D+

#### 2014:
Estimate based on estimated MCV1. GoC=R+ D+

#### 2013:
Estimate based on estimated MCV1. GoC=R+ D+

#### 2012:
Estimate based on estimated MCV1. GoC=R+ D+

#### 2011:
Estimate based on estimated MCV1. GoC=R+ D+

#### 2010:
Estimate based on estimated MCV1. GoC=R+ D+

#### 2009:
Estimate based on estimated MCV1. GoC=R+ D+

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.
The WHO and UNICEF estimates of national immunization coverage (venic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

- Estimate is supported by reported data [R+], coverage recalculated with an independent denominator from the World Population Prospects: 2020 revision from the UN Population Division (D+), and at least one supporting survey within 2 years [S+]. While well supported, the estimate still carries a risk of being wrong.
- Estimate is supported by at least one data source; [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-], challenges the estimate.
- There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.

### Description:

- **2020:** Estimate based on coverage reported by national government. Reported data reflects stresses affecting the health system. Programme reports an eight month vaccine stock-out of disposable syringes, five months for reconstitution syringes and of unknown duration for AD syringes at national and subnational levels. No nationally representative household survey within the last 5 years. WHO and UNICEF recommend a high-quality survey to confirm reported levels of coverage. Programme reports a four month vaccine stock-out at national and subnational levels. GoC=R+ D+

- **2019:** Estimate based on coverage reported by national government. GoC=R+ D+

- **2018:** Estimate based on coverage reported by national government. Decline of reported data likely reflects disruption of health services due to economic and humanitarian crisis. Programme reports stock-out of vaccine delivery supplies (syringes). GoC=R+ D+

- **2017:** Estimate based on interpolation between reported values. Reported data excluded due to an increase from 56 percent to 74 percent with decrease 55 percent. Programme reports four month stock-out of syringes. Estimate challenged by: D-

- **2016:** Estimate based on coverage reported by national government. Reported coverage in 2016 reflects doses delivered within 24 hours. Previous years are likely an overestimate of coverage within 24 hours. GoC=R+ D+

- **2015:** Estimate based on interpolation between reported values. Reported data excluded due to an increase from 45 percent to 89 percent with decrease 56 percent. Estimate challenged by: D-

- **2014:** Estimate based on interpolation between reported values. Reported data excluded due to decline in reported coverage from 80 percent to 45 percent with increase to 89 percent. Programme reports one month stock-out of Hep B vaccine at national level. Reported official estimates are inconsistent with other vaccines and unexplained adjustment from the administrative coverage. Estimate challenged by: D-

- **2013:** Estimate based on coverage reported by national government. Estimate is based on official government estimate. GoC=R+ D+

- **2012:** Estimate based on coverage reported by national government. One month stock-out reported at national level. GoC=R+ D+

- **2011:** Estimate based on coverage reported by national government. GoC=R+ D+

- **2010:** Estimate based on coverage reported by national government. GoC=R+ D+

- **2009:** Estimate based on coverage reported by national government. GoC=R+ D+
