BACKGROUND NOTE: Each year WHO and UNICEF jointly review reports submitted by Member States regarding national immunization coverage, finalized survey reports as well as data from the published and grey literature. Based on these data, with due consideration to potential biases and the views of local experts, WHO and UNICEF attempt to distinguish between situations where the available empirical data accurately reflect immunization system performance and those where the data are likely to be compromised and present a misleading view of immunization coverage while jointly estimating the most likely coverage levels for each country.

WHO and UNICEF estimates are country-specific; that is to say, each country’s data are reviewed individually, and data are not borrowed from other countries in the absence of data. Estimates are not based on ad hoc adjustments to reported data; in some instances empirical data are available from a single source, usually the nationally reported coverage data. In cases where no data are available for a given country/vaccine/year combination, data are considered from earlier and later years and interpolated to estimate coverage for the missing year(s). In cases where data sources are mixed and show large variation, an attempt is made to identify the most likely estimate with consideration of the possible biases in available data. For methods see:

*Brown et al. 2013. An introduction to the grade of confidence used to characterize uncertainty around WHO and UNICEF estimates.

OFFICIAL COVERAGE: Official coverage is based on national authorities’ reports and their estimates of national immunization coverage, published and grey literature. Official coverage is developing a national immunization schedule recommending either (i) a primary series of three doses of IPV alone, WHO and UNICEF estimate for IPV1 reflect coverage with at least one routine dose of IPV among infants <1 year of age among countries. For countries utilizing IPV containing vaccine use only, i.e., no recommended dose of OPV, the WHO and UNICEF estimate for IPV1 corresponds to coverage for the 1st dose of IPV.

Production of IPV coverage estimates, which begins in 2015, results in no change of the estimated coverage levels for the 3rd dose of polio (Pol3). For countries recommending routine immunization with a primary series of three doses of IPV alone, WHO and UNICEF estimated Pol3 coverage is equivalent to estimated coverage with three doses of IPV. For countries with a sequential schedule, estimated Pol3 coverage is based on that for the 3rd dose of polio vaccine regardless of vaccine type.

MCV1: percentage of surviving infants who received the 1st dose of measles containing vaccine. In countries where the national schedule recommends the 1st dose of MCV at 12 months or later based on the epidemiology of disease in the country, coverage estimates reflect the percentage of children who received the 1st dose of MCV as recommended.

MCV2: percentage of children who received the 2nd dose of measles containing vaccine according to the nationally recommended schedule.

RCV1: percentage of surviving infants who received the 1st dose of rubella containing vaccine. Coverage estimates are based on WHO and UNICEF estimates of coverage for the dose of measles containing vaccine that corresponds to the first measles-rubella combination vaccine. Nationally reported coverage of RCV is not taken into consideration nor are the data represented in the accompanying graph and data table.

HepBB: percentage of births which received a dose of hepatitis B vaccine within 24 hours of delivery. Estimates of hepatitis B birth dose coverage are produced only for countries with a universal birth dose policy. Estimates are not produced for countries that recommend a birth dose to infants born to HepB virus-infected mothers only or where there is insufficient information to determine whether vaccination is within 24 hours of birth.

HepB3: percentage of surviving infants who received the 3rd dose of hepatitis B containing vaccine following the birth dose.

Hib3: percentage of surviving infants who received the 3rd dose of Haemophilus influenzae type b containing vaccine.

RotaC: percentage of surviving infants who received the final recommended dose of rotavirus vaccine, which can be either the 2nd or the 3rd dose depending on the vaccine.

PeV3: percentage of surviving infants who received the 3rd dose of pneumococcal conjugate vaccine. In countries where the national schedule recommends two doses during infancy and a booster dose at 12 months or later based on the epidemiology of disease in the country, coverage estimates may reflect the percentage of surviving infants who received two doses of PCV prior to the 1st birthday.

YFV: percentage of surviving infants who received one dose of yellow fever vaccine in countries where YFV is part of the national immunization schedule for children or is recommended in at risk areas; coverage estimates are annualized for the entire cohort of surviving infants.

July 1, 2023; page 2 WHO and UNICEF estimates of national immunization coverage - next revision available July 15, 2024 data received as of June 26, 2023
The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

••• Estimate is supported by reported data [R+], coverage recalculated with an independent denominator from the World Population Prospects: 2022 revision from the UN Population Division (D+), and at least one supporting survey within 2 years [S+]. While well supported, the estimate still carries a risk of being wrong.

•• Estimate is supported by at least one data source; [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-], challenges the estimate.

• There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.
Canada - DTP1

Description:

2022: Estimate informed by 2019 reported data reflecting coverage by 24 months of age, consistent with reporting for DTP3 based on data from the Childhood National Immunization Coverage Survey. Reported coverage informed by 2019 Childhood National Immunization Coverage Survey. The 2021 Childhood National Immunization Coverage Survey is in the process of data analysis. Estimate challenged by: R-

2021: Estimate informed by 2019 reported data reflecting coverage by 24 months of age, consistent with reporting for DTP3 based on data from the Childhood National Immunization Coverage Survey. Reported coverage is based on 2019 Childhood National Immunization Coverage Survey. Estimate challenged by: R-

2020: Estimate is based on 2019 reported data reflecting coverage by 24 months of age, consistent with reporting for DTP3 based on data from the Childhood National Immunization Coverage Survey. Reported coverage does not reflect disruptions related to COVID-19. Estimate challenged by: R-

2019: Estimate is based on 2017 reported data reflecting coverage by 24 months of age, consistent with reporting for DTP3 based on data from the Childhood National Immunization Coverage Survey. Reported coverage of 87 percent for 2019 reflects that by three months of age. Reported coverage may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. Estimate challenged by: R-

2018: Estimate is based on 2017 reported data reflecting coverage by 24 months of age, consistent with reporting for DTP3 based on data from the Childhood National Immunization Coverage Survey. Reported coverage are obtained from the Childhood National Immunization Coverage Survey by three months of age and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2017: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey by three months of age and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2016: Estimate informed by interpolation between reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey by three months of age and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2015: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey. GoC=R+

2014: Estimate informed by interpolation between reported data. GoC=R+

2013: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey for children 24 months or less and may yield lower than actual immunization coverage given that records with incomplete or illegible

The WHO and UNICEF estimates of national immunization coverage (vwenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

### Description:

Estimates for a dose of inactivated polio vaccine (IPV) begin in 2015 following the Global Polio Eradication Initiative’s Polio Eradication and Endgame Strategic Plan: 2013-2018 which recommended at least one full dose or two fractional doses of IPV into routine immunization schedules as a strategy to mitigate the potential consequences should any re-emergence of type 2 poliovirus occur following the planned withdrawal of Sabin type 2 strains from oral polio vaccine (OPV).

2022: Estimate is based on 2019 reported data reflecting coverage by 24 months of age, consistent with reporting for DTP3 based on data from the Childhood National Immunization Coverage Survey. Reported coverage informed by 2019 Childhood National Immunization Coverage Survey. The 2021 Childhood National Immunization Coverage Survey is in the process of data analysis. Estimate challenged by: R-

2017: Estimate informed by reported data. GoC=R+

2016: Estimate informed by reported data. Reported data for MCV2 reflects survey results for the second dose of MMR by 7 years of age. GoC=R+

2015: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey. GoC=R+

2014: Estimate informed by reported data. GoC=R+

2013: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey for children 24 months or less and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

- Estimate is supported by reported data [R+], coverage recalculated with an independent denominator from the World Population Prospects: 2022 revision from the UN Population Division (D+). GoC=R+

- Estimate is supported by at least one data source; [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-], challenges the estimate. GoC=R+

- There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate. GoC=R+

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.
The WHO and UNICEF estimates of national immunization coverage (wunic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

For this revision, coverage estimates for the first dose of rubella containing vaccine are based on WHO and UNICEF estimates of coverage of measles containing vaccine. Nationally reported coverage of rubella containing vaccine is not taken into consideration nor are they represented in the accompanying graph and data table.

### Description:

#### 2022:
Estimate based on estimated MCV1. Reported coverage informed by 2019 Childhood National Immunization Coverage Survey. The 2021 Childhood National Immunization Coverage Survey is in the process of data analysis. GoC=R+

#### 2021:
Estimate based on estimated MCV1. Reported coverage is based on 2019 Childhood National Immunization Coverage Survey. GoC=R+

#### 2020:
Estimate based on estimated MCV1. Reported coverage does not reflect disruptions related to COVID-19. GoC=R+

WHO and UNICEF estimates of national immunization coverage - next revision available July 15, 2024  
data received as of June 26, 2023
The WHO and UNICEF estimates of national immunization coverage are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

- Estimate is supported by reported data [R+], coverage recalculated with an independent denominator from the World Population Prospects: 2022 revision from the UN Population Division (D+), and at least one supporting survey within 2 years [S+]. While well supported, the estimate still carries a risk of being wrong.
- Estimate is supported by at least one data source; [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-], challenges the estimate.
- There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.
The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. - Estimate is supported by reported data [R+] and at least one supporting survey within 2 years [S+]. While well supported, the estimate still carries a risk of being wrong.
- Estimate is supported by at least one data source; [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-]; challenges the estimate.
- There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.

### Description:

2022: Estimate informed by reported data. Reported coverage informed by 2019 Childhood National Immunization Coverage Survey. The 2021 Childhood National Immunization Coverage Survey is in the process of data analysis. GoC=R+

2021: Estimate informed by reported data. Reported coverage is based on 2019 Childhood National Immunization Coverage Survey. GoC=R+

2020: Estimate informed by reported data. Reported coverage does not reflect disruptions related to COVID-19. GoC=R+

2019: Estimate informed by reported data. GoC=R+

2018: Estimate informed by reported data. GoC=R+

2017: Estimate informed by reported data. Reported data reflects coverage for the six jurisdictions that recommend HepB vaccine among infants. GoC=R+

2016: Estimate informed by reported data. GoC=R+

2015: Estimate informed by reported data. Survey results ignored. Sample size 0 less than 300. Reported coverage are obtained from the Childhood National Immunization Coverage Survey. GoC=R+

2014: Estimate informed by reported data. GoC=R+

2013: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey for children 24 months or less and may yield lower than actual vaccination coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2012: Estimate informed by reported data. GoC=R+

2011: Estimate informed by reported data. Not all provinces immunized infants for Hep B in 2011.. GoC=R+

The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.

### Description:

2022: Estimate informed by reported data. Reported coverage informed by 2019 Childhood National Immunization Coverage Survey. The 2021 Childhood National Immunization Coverage Survey is in the process of data analysis. GoC=R+

2021: Estimate informed by reported data. Reported coverage is based on 2019 Childhood National Immunization Coverage Survey. GoC=R+

2020: Estimate informed by reported data. Reported coverage does not reflect disruptions related to COVID-19. Estimate based on reported coverage, though it is noted that coverage for this vaccine dose does not follow a similar trend that what is reported for other doses. GoC=R+

2019: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey for children 24 months or less and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2018: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey for children 24 months or less and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2017: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey for children 24 months or less and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2016: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey for children 24 months or less and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2015: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey. GoC=R+

2014: Estimate informed by reported data. Reported coverage is based on that for the third dose of polio vaccine administered in combination with Hib. The programme monitors the fourth dose of Hib containing vaccine at 2 years of age. GoC=R+

2013: Estimate informed by reported data. Reported coverage are obtained from the Childhood National Immunization Coverage Survey for children 24 months or less and may yield lower than actual immunization coverage given that records with incomplete or illegible dates are considered as vaccines not administered. GoC=R+

2012: Estimate informed by reported data. GoC=R+

2011: Estimate informed by reported data. GoC=R+
The WHO and UNICEF estimates of national immunization coverage (wuenic) are based on data and information that are of varying, and, in some instances, unknown quality. Beginning with the 2011 revision we describe the grade of confidence (GoC) we have in these estimates. As there is no underlying probability model upon which the estimates are based, we are unable to present classical measures of uncertainty, e.g., confidence intervals. Moreover, we have chosen not to make subjective estimates of plausibility/certainty ranges around the coverage. The GoC reflects the degree of empirical support upon which the estimates are based. It is not a judgment of the quality of data reported by national authorities.

- ••• Estimate is supported by reported data [R+], coverage recalculated with an independent denominator from the World Population Prospects: 2022 revision from the UN Population Division (D+), and at least one supporting survey within 2 years [S+]. While well supported, the estimate still carries a risk of being wrong.
- •• Estimate is supported by at least one data source; [R+], [S+], or [D+]; and no data source, [R-], [D-], or [S-]; challenges the estimate.
- • There are no directly supporting data; or data from at least one source; [R-], [D-], [S-]; challenge the estimate.

In all cases these estimates should be used with caution and should be assessed in light of the objective for which they are being used.

WHO and UNICEF estimates of national immunization coverage - next revision available July 15, 2024 data received as of June 26, 2023
NOTE: A survey to measure vaccination coverage for infants (i.e., children aged 0 to 11 months) will sample children aged 12 to 23 months at the time of survey to capture the youngest annual cohort of children who should have completed the vaccination schedule. Because WUENIC are for infant vaccinations, survey data in this report are presented to reflect the birth year of the youngest survey cohort. For example, results for a survey conducted during December 2020 among children aged 12 to 23 months at the time of the survey reflect the immunization experience of children born in 2019. Depending on the timing of survey field work, results may reflect the immunization experience of children born and vaccinated 1 or 2 years prior to the survey field work.
